

# Earth Observing System (EOS) Data and Information System (EOSDIS)

## **Project Status**

## **MODIS Science Team Meeting**

Earth Science Data and Information System (ESDIS) Project
NASA/Goddard Space Flight Center

October 12, 1994

## Outline

- □ EOSDIS Status
  - Schedule
  - Systems Status
  - Version 0
- □ EOSDIS Rebaselining Impacts
- □ Challenges and Issues
- PDR Technical Baseline
- □ PDR Process
- ☐ Independent Architecture Studies

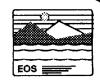

#### **EOSDIS Development, Integration and Certification**

STATUS AS OF 9/26/94 LAST CHANGE 9/26/94

EOS Instruments; NSCAT, TOMS.
 EOS Instruments; CERES, LIS.
 IVV testing also performed on each EDOS and ECOM release.

## Systems Status

- EOSDIS Core System (ECS)
  - System Design Review Held June 27-29
    - Six "Key Issue" RIDs Being Addressed
  - Second Release of PGS Toolkit Delivered to Investigator Teams
- EOS Data and Operations System (EDOS)
  - Contract Awarded to TRW
  - Assessing Alternatives to Meet EOS Baseline Reductions
- EOS Communications (Ecom)
  - In-House Development
  - Preliminary Design Review (PDR) Rescheduled to January 1995
  - Mass buy "Science and Engineering Workstation Procurement (SEWP)" contract enables shortened procurement time and extended prototyping with ATM

## Systems Status (Continued)

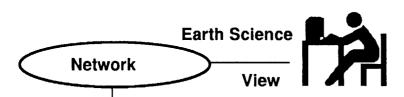

- Independent Verification and Validation (IV&V)
  - Contract Awarded to Intermetrics in June
  - Initiated Assessment of V0
- EOSDIS Test System
  - Scheduled for Development by December 1996
  - In-House Development
  - Functions:
    - Generate RS-Encoded Virtual Channel/Packet Data Streams at 150 Mbps for Input to EDOS
    - Simulate EDOS-Produced Datasets for Input to DAACs
    - Receive and Validate Commands, Generate Simulated Low-Rate Telemetry in Response to Commands (COP-1 Protocol)

## Version 0 Operational Prototype

NOAA Satellite

Active Archive Center

- Joint development of system level functions to distribute queries and integrate results across existing DAAC systems
- DAAC development of unique data functions

Prototype Information Management System (IMS)

ORNL GSFC LaRC · MSFC · JPL · EDC (USGS) · (NOAA) · of Alaska) Affiliated Data Center

**Status** 

- Tested by DAAC User Working Groups During August
- Opened for Earth Science Community Use August 31
  - Catalog of 100 Datasets Accessible Across 8 DAACs
  - Search and Order from 8 DAACs
  - Browse from 5 DAACs

## **EOS Rebaselining Impacts**

- Remove Requirements for 24-Hour Production of Data Products at Each Level of Processing
  - Allow More Flexibility in Buffering/Communications Link/Media Shipment Trades
  - Allow Substitution of Buffering and Processing Capacity To Reduce System Complexity
- Delete Quicklook Capability
- Reduction of DAAC Operations for Non-Prime Shifts Some "Lights-Out" Operation
- Data Acquisition Request (DAR) Support Deleted From EOS
   Operations Center (DARs for ASTER Assumed To Be Supported by Japan's ASTER Ground System)

# EOS Rebaselining Impacts (Continuing)

- Full Standard Data Product Capacity Deferred (To Support Algorithm Integration and Test (1X), Primary Production (1X), and 2x Primary Production Capacity for Reprocessing)
  - At Launch Capacity Limited to Primary Production Capacity, But Must Support Both I&T and Product Generation
  - Full (4x) Capacity 2 Years After Launch
- Consolidation of EDOS Functions at Fairmont, WVA
- Reduction in Project Prototyping Budget
- ECS System Scheduling Optimization To Reduce Waiting Storage
- Flight Operations Segment To Use Existing Interfaces to TDRSS Network Control Center

## Issues and Challenges

#### 1. Science Requirements Management

#### Actions:

- Ad Hoc Working Group on Production Plans formed to improve characterization of product generation process and dependencies, and to validate parameters. Co-chairs: Mel Banks, Bruce Barkstrom
- EOSDIS Project Scientist (Steve Wharton) leading science definition of phasing of products from experimental to routine production

#### Next Steps:

- Develop ECS cost estimate for product set and iterate with project scientist if not with budget envelope
- Establish resource bounds for instruments and products

### 2. Implementing the EOS Rebaseling

#### Action:

 HQ Program Control Board Meeting held October 5 to baseline Level 1 requirements changes. Few clarification issues being worked

#### Next Step:

- Translate Level 1 changes to Level 2 and Level 3 requirements

# Issues and Challenges (Continued)

#### 3. EDOS Schedule

#### Action:

- Assure readiness to support AM-1 given delays in contract award Next Step:
- Identify critical path
- 4. Proposed Rescheduling of Development Milestones for Science Data Processing Segment (SDPS) of ECS
  - Slip in PDR from December 1994 to February 1995, with offsetting compression of code and unit test phase

#### Action:

- Assessing feasibility of schedule based on experience in comparable projects
- 5. Science Community Perception of EOSDIS Cost as "Impenetrable"

#### Action:

Presented details of project and ECS budget after SDR

#### Next Steps:

 Understand science perceptions of EOSDIS functions and map cost breakdowns into terms better understood by the community

# Issues and Challenges (Continued)

6. Minimize Functions and Costs That Do Not Directly Support Science

#### Action:

- Derived requirements scrubbed in program rebaselining process

#### Next Step:

- Continue to identify efficiencies and question derived requirements to reduce cost
- 7. Version 0 Network Performance Users View of Version 0 Performance Is Dependent on Performance of Internet Links Needed To Connect to the the DAAC

#### Action:

- Determining minimum effective throughput needed for reasonable response, and advising user services representatives at DAACs

#### Next Step:

- Port Version 0 client for downloading to user sites

## ECS PDR Technical Baseline

- Need to Freeze Baseline for Purposes of PDR
  - Budget limits at launch processing and archive capacity to approximately the production capacity for the February 1994 version of the standard data product list
  - At-launch product baseline will be a combination of full products and reduced (i.e., temporal, spatial, or spectral resolution) products, with system capacity increased to support full resolution products 2 years after launch
  - Steve Wharton has worked with investigators to develop a reduced product set and phase-in plan
  - Bruce Barkstrom's Ad Hoc Working Group on Production Plans has developed a more detailed characterization of the production process (files, product generation executables, and activation scenarios)
  - Hardware to support baseline will be estimated using cost model. If cost exceeds budget profile, adjustments to the baseline will be required

## Changes to ECS Design Review Process

#### Objective:

Reduce cost of review process

#### Changes:

- Replace formal presentations to broad community with system segment design reviews by small teams of technical experts
- Separate reviews will be held for Science Data Processing, Communications and System Management, and Flight Operations Segments
- Small Board, including science and DAAC representatives, will evaluate:
  - Findings of segment technical teams
  - System level design readiness, presented by Hughes and the project
- Alternative approaches will need to be established to communicate progress to the science community

## Independent Architecture Studies

### Study Objectives:

- Identify alternative architectures for ECS, considering future Earth science data and information needs and future technology projections in computer science and information systems
- University of California, North Dakota, and George Mason teams presented study results to "Evaluation Panel" on September 21-22
- Teams approached the problem from different perspectives
  - University of California: DBMS-centric approach
  - North Dakota: Applications users
  - George Mason: System extensions to Global Change
- Evaluation Panel included Data Panel, computer science, DAAC, HQ, Project, and Hughes representatives
- Evaluation Panel categorized ideas and recommendations, and identified actions needed, with support from Hughes Research Lab
  - Items to be considered during PDR (must fit within schedule and budget)
  - Evolvability target—Items which should be considered in future generations to the architecture
  - Items needing further research
  - Items requiring changes in program scope
