

# Linearity/Non-Linearity

SIS(100) investigations  
Raw Data examples and outliers  
fitting ranges  
residuals

# Linearity Introduction

- Several bands showing non-linear response at low radiances
- Problem: no clearly identified mechanism
  - Optics, Si detectors are usually very linear
  - electronics are measured linear to 8 bits with Ecal
    - ramp data not yet examined
    - ADCs 16 bit data gives mixed results
  - Possible mechanism in ROICs
- Request from August Workshop that we re-examine linearity of SIS(100) calibration
  - SBRS stands behind linearity of SIS(100) output and calibration
  - Landsat data \*may\* indicate small nonlinearity in calibration

## Linearity introduction 2

- Fitting over range of  $0.3L_{typ}$  to  $0.9L_{max}$ 
  - may wish to switch to 0 to  $0.9L_{max}$ 
    - however, there are often only one or two additional data points
      - Spec.  $L_{typ}$  is very close to low end of dynamic range, which was set by  $L_{max}$  requirements.
    - feedback appreciated
- Rejecting obvious outliers
  - cause not yet identified
- First cut at residuals indicates some possible improvement in going to non-linear algorithm

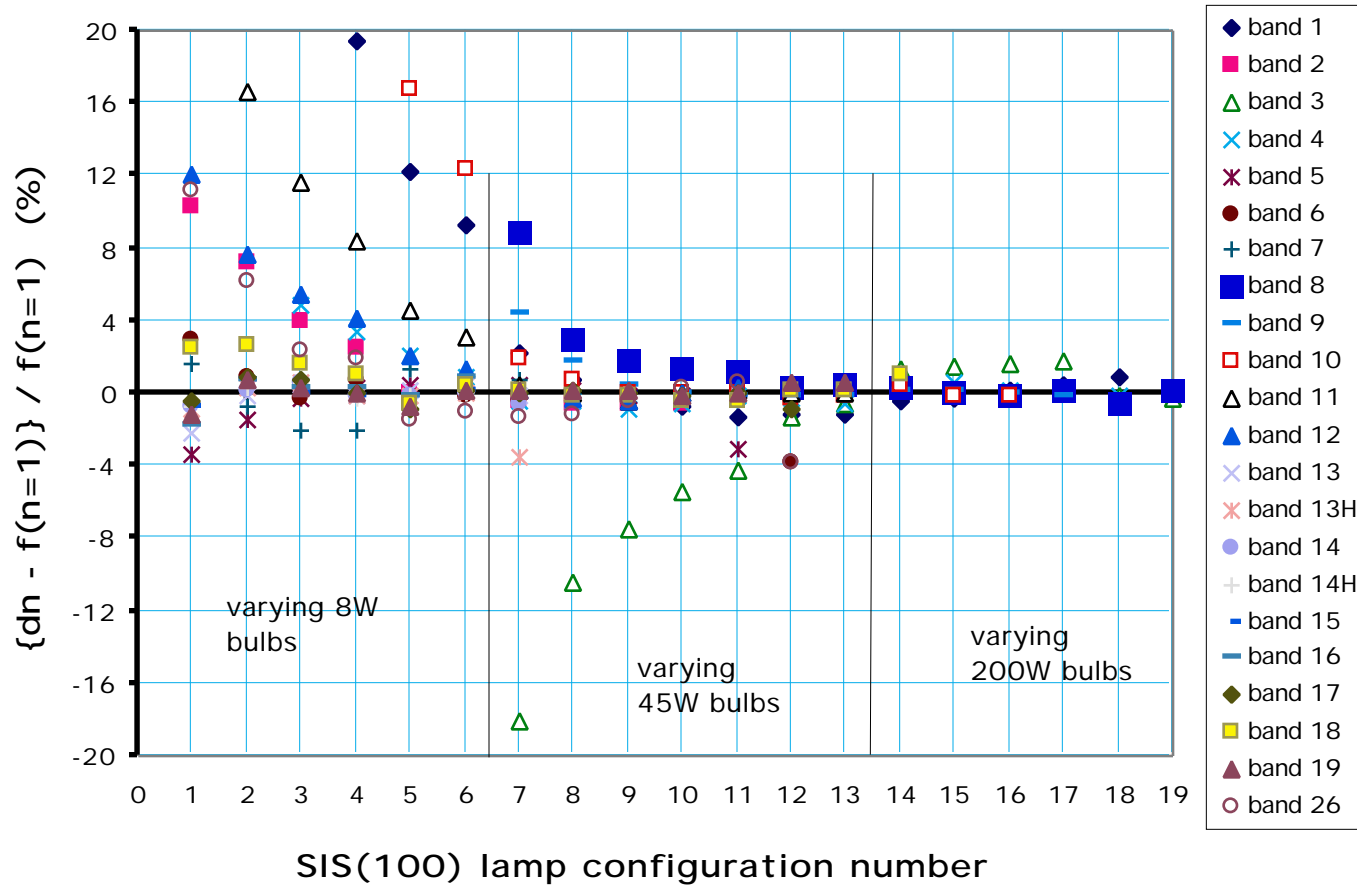

# SIS(100) Investigations

- SIS(100) calibrated at multiple bulb levels
  - MCST has not reviewed January 1997 calibration of SIS(100)
  - Calibration transfer spectrometer linear to 0.5%
  - Uncertainties provided to date are only at one level and only as a percentage
    - need to know how uncertainties scale with radiance before final curve fit coefficients can be determined
  - Plots against lamp configurations indicate non-linearity not limited to one configuration or set of bulbs
- Landsat, using a transfer radiometer, observes small non-linearities in SBRS calibration values
  - \*But\* we don't overlap on all bulb levels
  - \*And\* we see much more non-linearity than Landsat attributes to the sphere

**Relative residuals in Linear fittings (0.3 L<sub>typ</sub> to 0.9 L<sub>max</sub>)  
as a function of SIS lamp configurations for all  
reflective bands, middle channel, sample 1, UAID 1504**

# Bulb Configurations for RC01 Tests

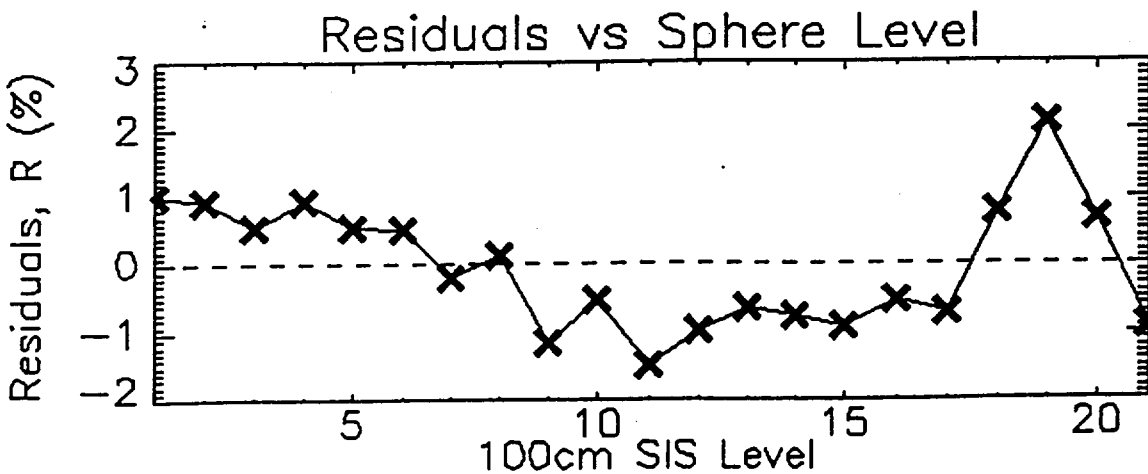

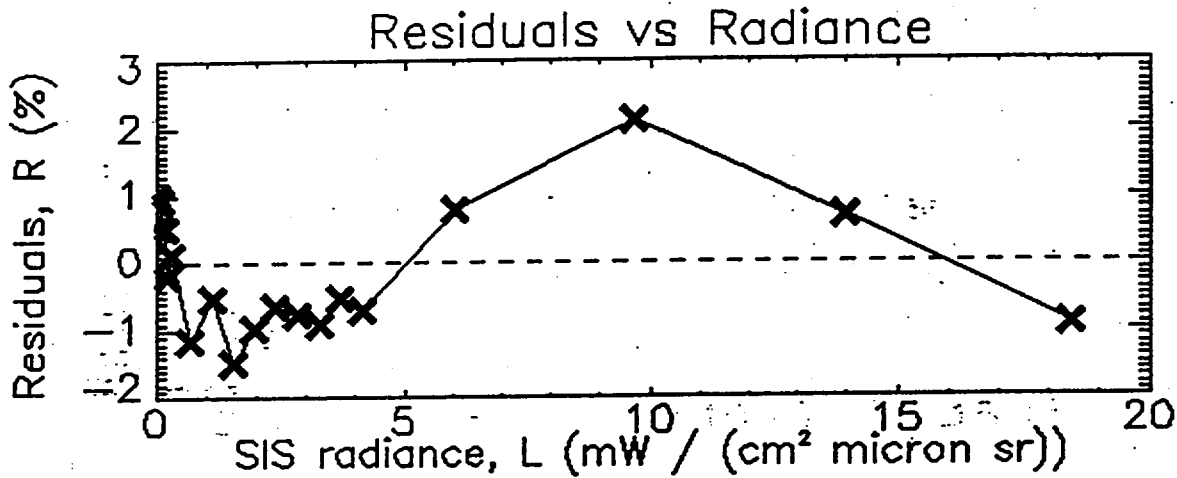

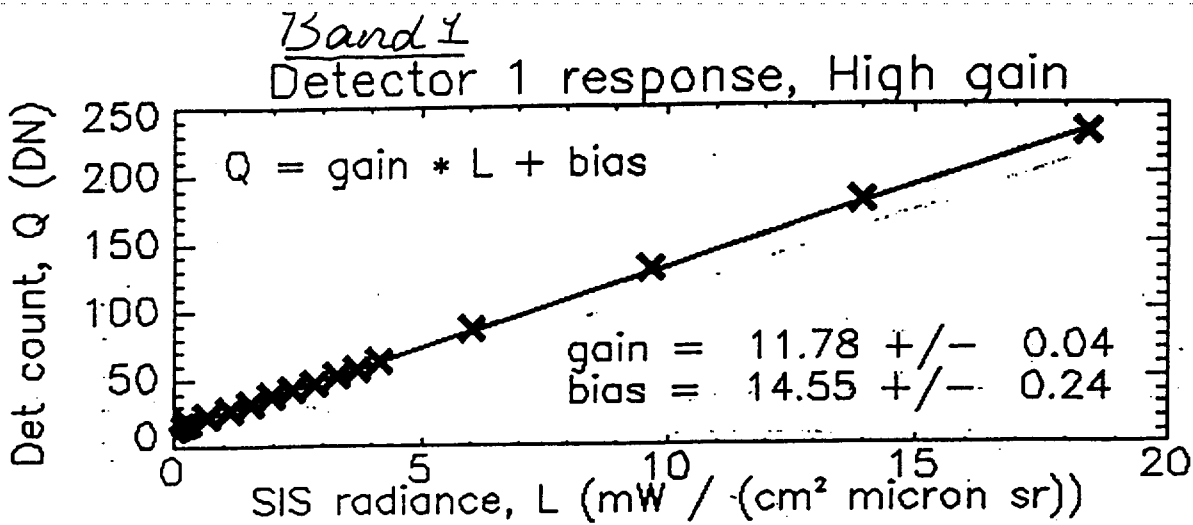

Config_Number	SIS_Lamp_Numbers 8W_45W_200W	Bands at Ltyp	Bands at Saturation
1	1_0_0	5,7,18	
2	2_0_0	16	
3	3_0_0	17,26	
4	4_0_0	6,14,15,19	
5	5_0_0	13	16
6	8_0_0	2	
7	10_1_0	1	15
8	10_2_0	12	13,14
9	10_3_0	4,11	
10	10_4_0		
11	10_5_0		5
12	10_8_0	10	7,26
13	10_9_0	3	6,12,17
14	10_9_1	9	11,18
15	10_9_2		2
16	10_9_3		
17	10_9_4	8	10
18	10_9_8		
19	10_9_14		4

# Landsat look at SIS(100) linearity

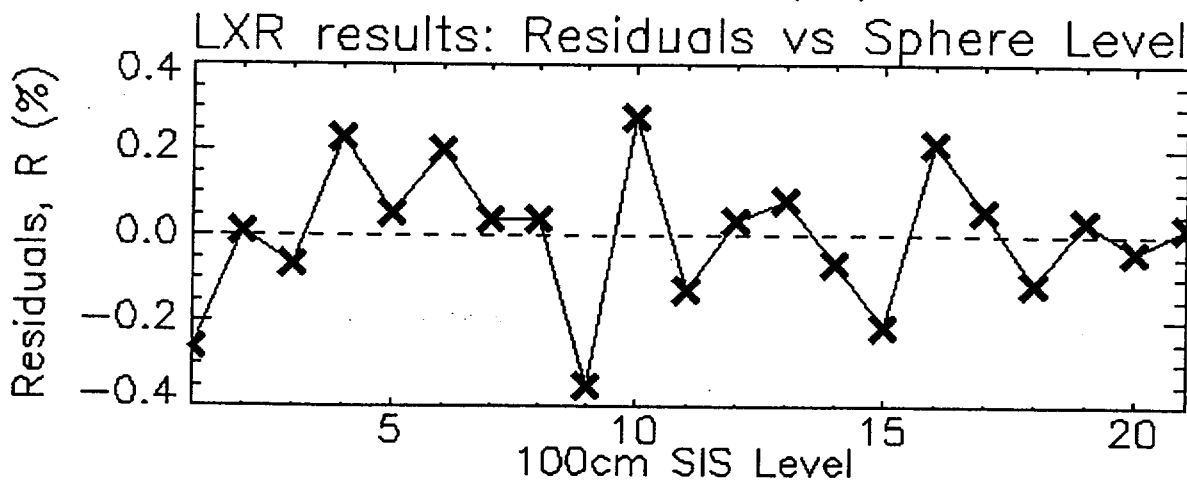

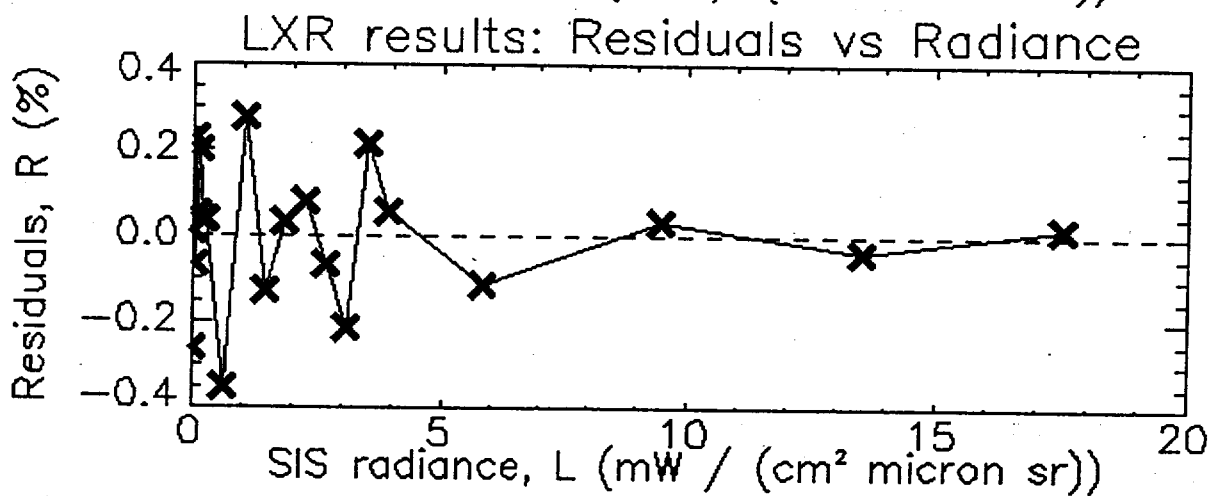

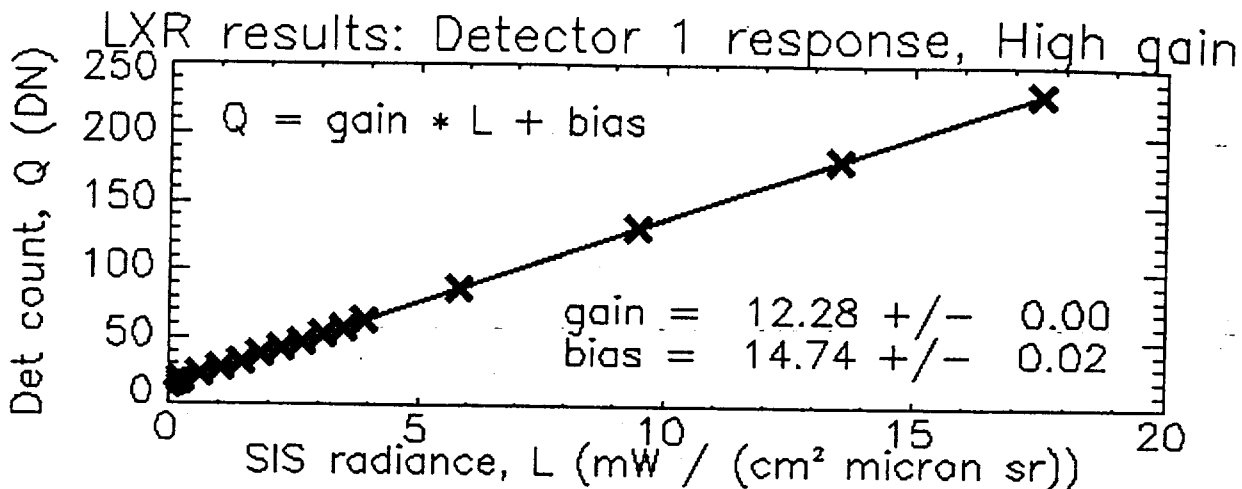

- **\*Preliminary\*** results from John Barker
- Landsat had their transfer radiometer (LXR) look at the SIS(100) at the same time Landsat was
- Residuals to a linear fit, when using SBRS values for the calibration of the SIS(100) are ~1% and show some non-linear behavior
- Residuals to a linear fit, when using the simultaneous LXR values to redo the calibration of the SIS(100) are ~0.2% and are very linear

Linear Fit over 2 different L ranges

Line Fit Plot (OL to 0.9L<sub>max</sub>)

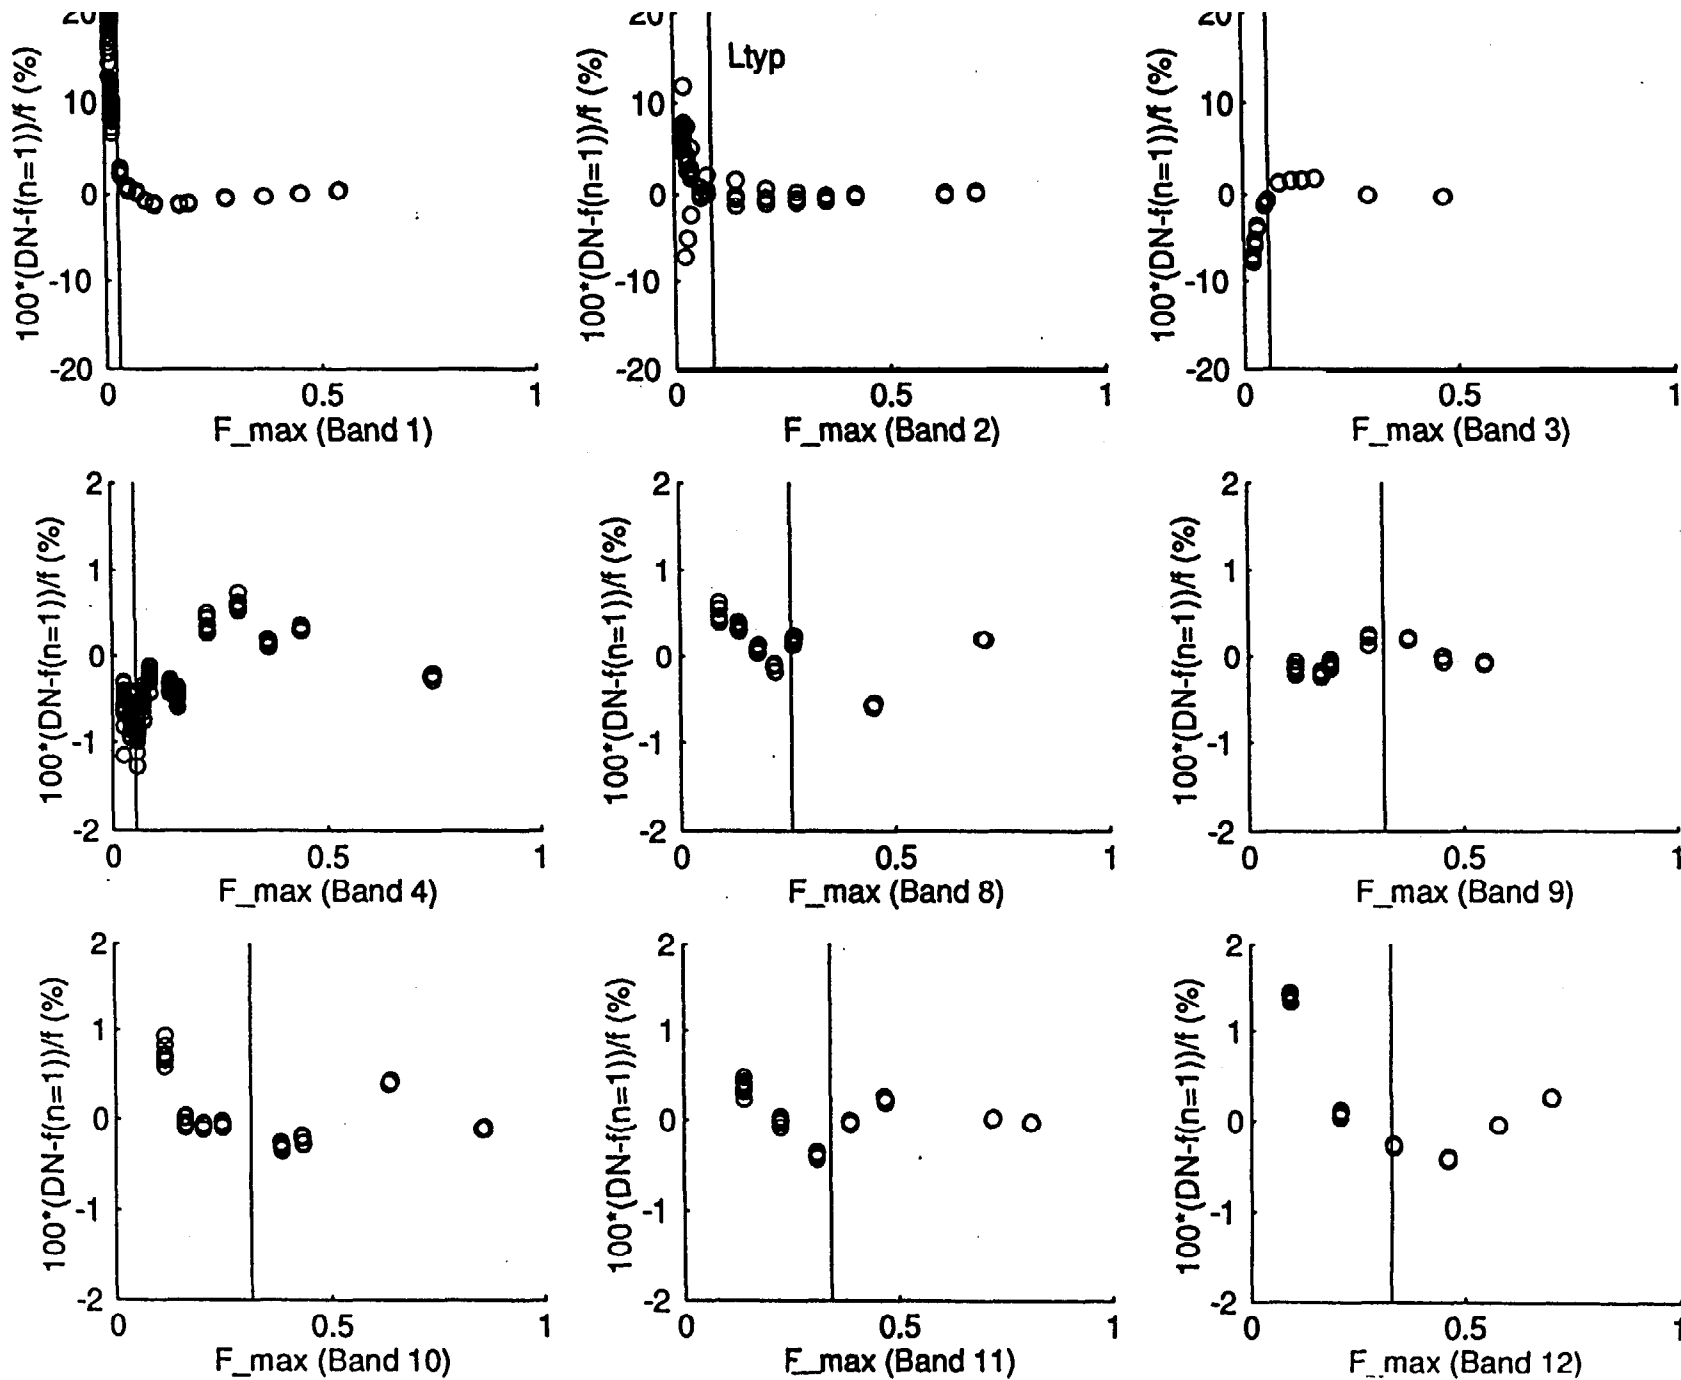

Residuals indicate some improvement in going to non-linear algorithm for some bands

- Caveats:
  - Still a work in progress
  - Following residuals plotted vs. dn instead of DN\*
  - Following residuals do not incorporate SIS(100) uncertainty when computing fit
  - %Residual does not necessarily translate directly into %uncertainty in product
- Possible improvement in bands 1, 2, 3, 5, 6, 12, 16, 18, 26.

Relative residual of DN\_vs\_L linear fitting in VIS/NIR bands (0.3Ltyp to 0.9Lmax). UAID 1504, primary, nominal plateau, sample 1

Relative residual of DN\_vs\_L linear fitting in NIR bands (0.3Ltyp to 0.9Lmax). UAID 1504, primary, nominal plateau

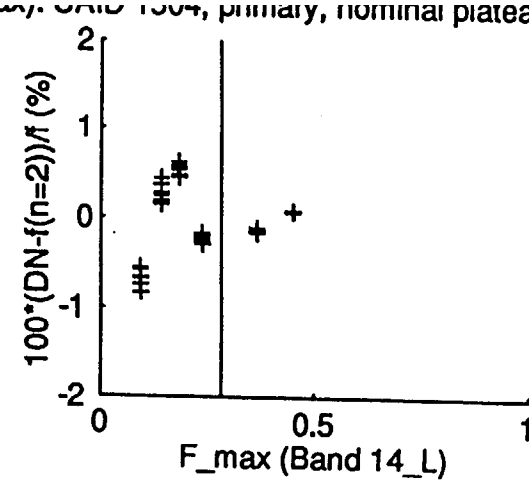

Relative residual of DN\_vs\_L linear fitting in SWIR bands (0.3L<sub>typ</sub> to 0.9L<sub>max</sub>). UAID 1504, primary, nominal plateau, sample 1

Relative residual of DN\_vs\_L quadratic fitting in VIS/NIR bands (0.3L<sub>typ</sub> to 0.9L<sub>max</sub>). UAID 1504, primary, nominal plateau, sample 1

Relative residual of DN\_vs\_L quadratic fitting in NIR bands (0.3Ltyp to 0.9Lmax). UAID 1504, primary, nominal plateau

Relative residual of DN\_vs\_L quadratic fitting in SWIR bands (0.3L<sub>typ</sub> to 0.9L<sub>max</sub>). UAID 1504, primary, nominal plateau, sample 1

Relative residuals in L from linear and quadratic fittings at 0.3Ltyp, Ltyp and 0.9Lmax

Relative residuals in L from linear and quadratic fittings at 0.3Ltyp, Ltyp and 0.9Lmax

Band center  $\lambda$  in nm (band 8,9,3,10,11,12,4) in VIS FP  
 For each band, listed in order: L\_0.3Ltyp, Q\_0.3Ltyp, L\_Ltyp, Q\_Ltyp, L\_0.9Lmax, Q\_0.9Lmax

Relative residuals in L from linear and quadratic fittings at 0.3Ltyp, Ltyp and 0.9Lmax

Band center  $\lambda$  in nm (1,13,13H,14,14H,15,2,16,17,18,19) in NIR FP

For each band, listed in order: L\_0.3Ltyp, Q\_0.3Ltyp, L\_Ltyp, Q\_Ltyp, L\_0.9Lmax, Q\_0.9Lmax

Relative residuals in L from linear and quadratic fittings at 0.3Ltyp, Ltyp and 0.9Lmax

Band center  $\lambda$  in nm (1,13,13H,14,14H,15,2,16,17,18,19) in NIR FP  
 For each band, listed in order: L\_0.3Ltyp, Q\_0.3Ltyp, L\_Ltyp, Q\_Ltyp, L\_0.9Lmax, Q\_0.9Lmax

Relative residuals in L from linear and quadratic fittings at 0.3Ltyp, Ltyp and 0.9Lmax

Band center λ in nm (band 5,26,6,7) in SWIR FP

For each band, listed in order: L\_0.3Ltyp, Q\_0.3Ltyp, L\_Ltyp, Q\_Ltyp, L\_0.9Lmax, Q\_0.9Lmax
