

MODIS Meeting  
College Park, MD  
19 May 2011

# **Using MODIS snow cover fraction in the NASA GEOS-5 modeling and assimilation system**

*Rolf Reichle, Ally Toure, and Gabrielle De Lannoy*

***Global Modeling and Assimilation Office  
NASA Goddard Space Flight Center  
Phone: 301-614-5693  
Email: [Rolf.Reichle@nasa.gov](mailto:Rolf.Reichle@nasa.gov)***

## Outline

ROSES Terra/Aqua proposal:

***“Enhancing NASA GEOS data products through multi-variate assimilation of land surface observations from Aqua and Terra”***

Just getting started...

***This presentation:***

- 1. Evaluation of GEOS-5 products vs. MODIS SCF***
- 2. Assimilation of MODIS SCF***

---

- 3. The SMAP Level 4 Carbon product***

## ***NASA/GMAO GEOS-5 products***

***MERRA:*** Recently completed re-analysis

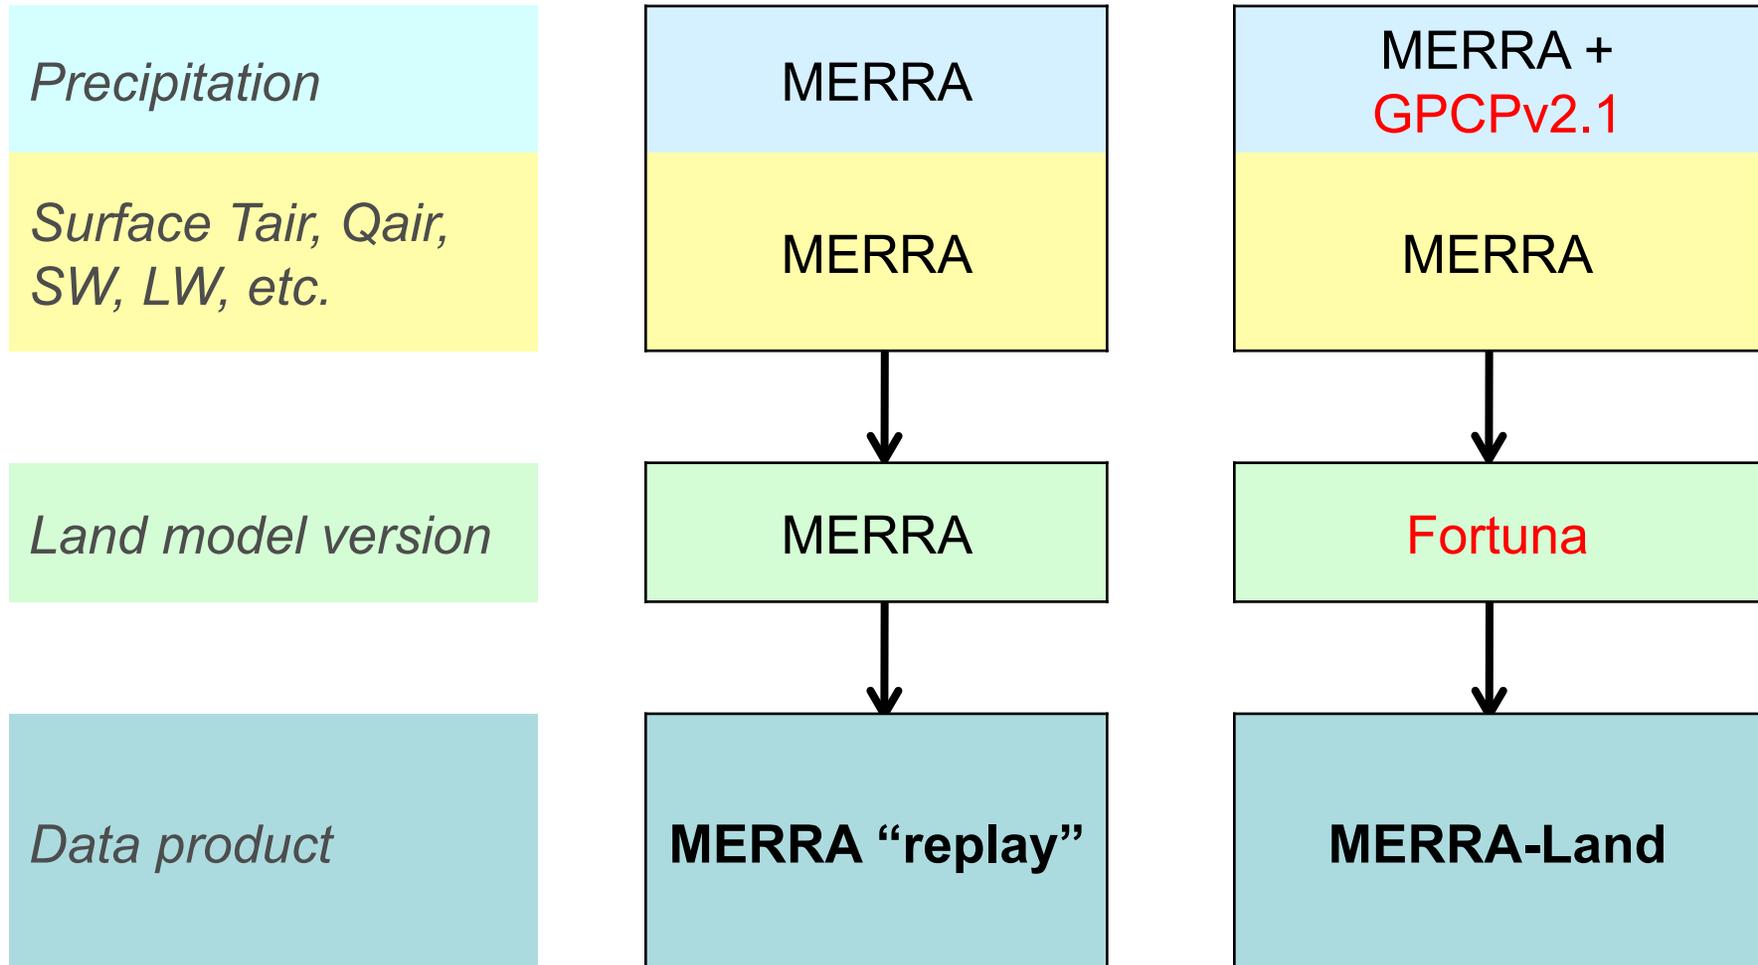

- **GEOS-5.2.0**
- **1979-present, continued** updates w/ **~1 month latency**, global
- Resolution: **Lat=0.5° Lon=0.67°**, 72 vertical levels
- **MERRA-Land:** Enhanced land enhanced product for land surface hydrological applications (Reichle et al., J. Clim., 2011)

### ***“Forward processing”***

- **Near-real time**, global
- Currently using GEOS-5.2.0
- From ~June 2011:  
    **GEOS-5.7.1** (incl. GCM revisions a.k.a. “Fortuna”)  
    Resolution: **Lat=0.25° Lon=0.3125°**, 72 vertical levels

## Land-only (“off-line”) replay

## Catchment land surface model parameter changes

Parameter	Description	Units	MERRA	Fortuna
SATCAP	Capacity of canopy interception reservoir	kg/m <sup>2</sup>	1.0*LAI	0.2*LAI
FWETL	Areal fraction of canopy leaves onto which large-scale precipitation falls	[-]	1.0	0.02
FWETC	Same as FWETL but for convective precipitation	[-]	0.2	0.02
WEMIN	Min. SWE in snow-covered area fraction	kg/m <sup>2</sup>	13	26
DZ1MAX	Max. depth of uppermost snow layer	m	0.05	0.08

**MERRA-Land** has improved estimates of soil moisture, runoff, canopy interception, and evapotranspiration (Reichle et al., J. Clim., 2011),

**BUT**

if we look at snow cover fraction and compare to MODIS...

# Categorical analysis of snow cover fraction vs. MODIS

MOD10C2,  
aggregated to  
monthly avg. SCF

MERRA SCF  
agrees well with  
MODIS SCF  
observations.

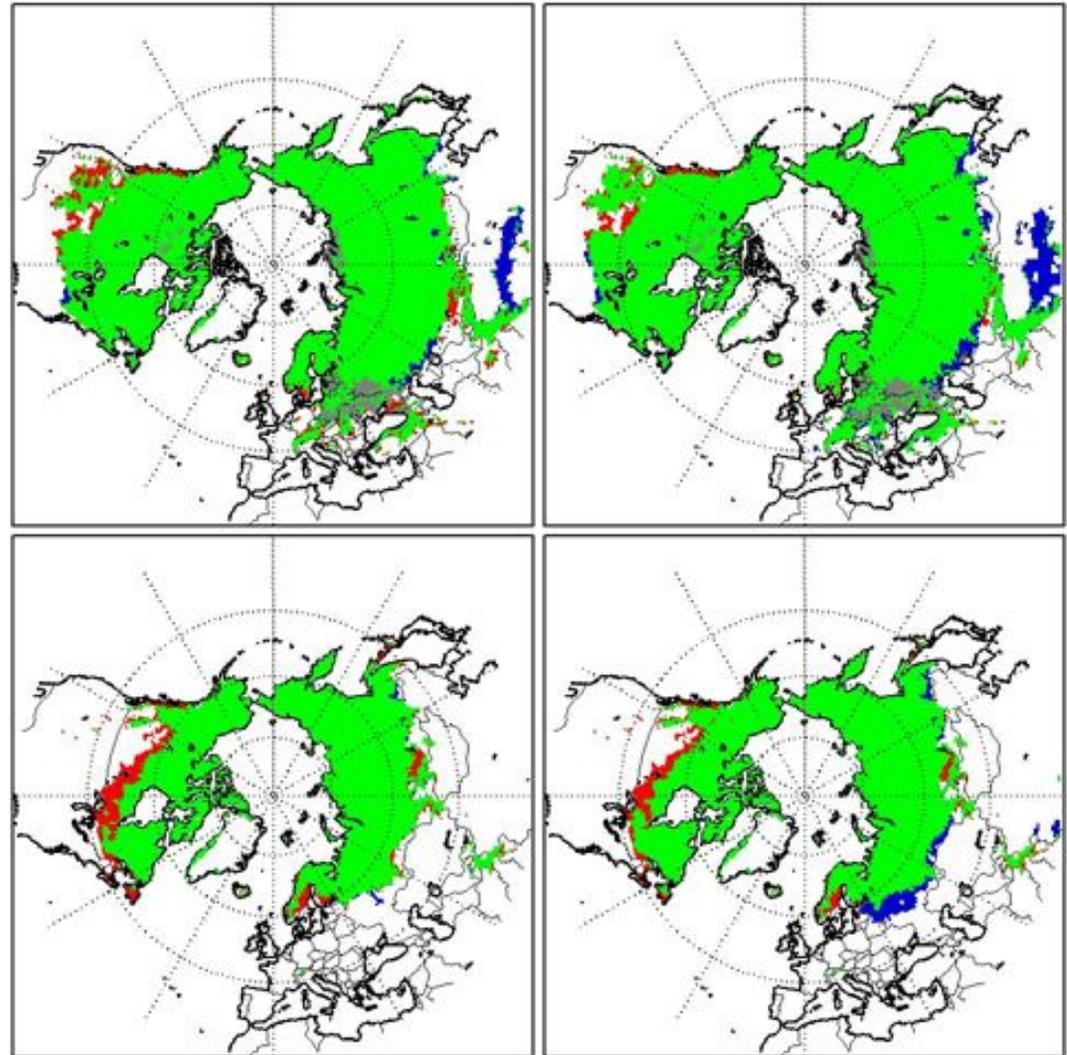

False alarm rate  
increases in  
MERRA-Land.

Feb 2004

Apr 2004

MERRA

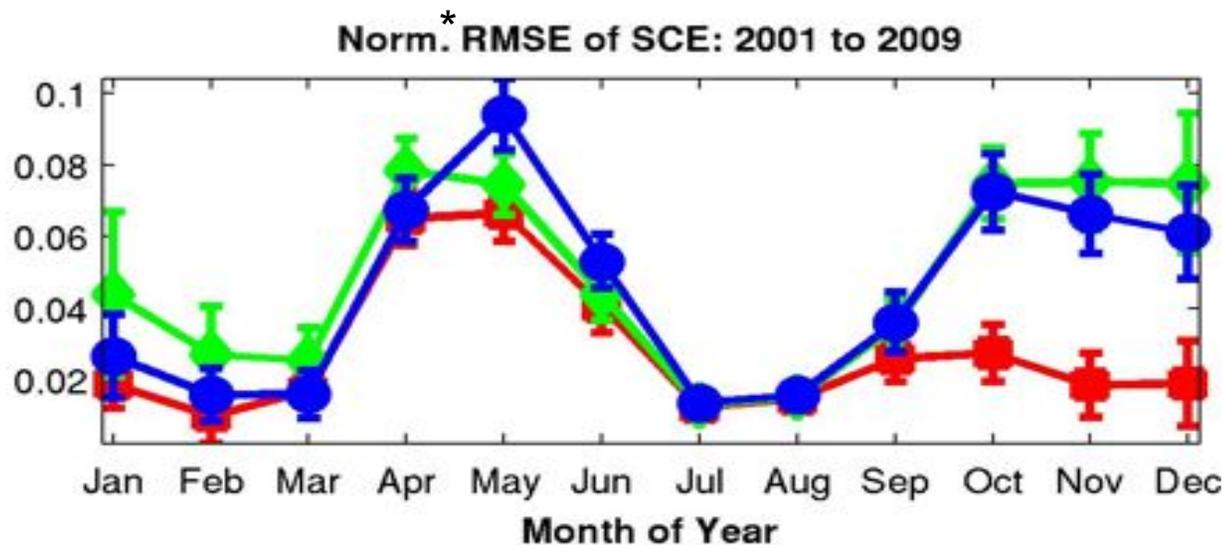

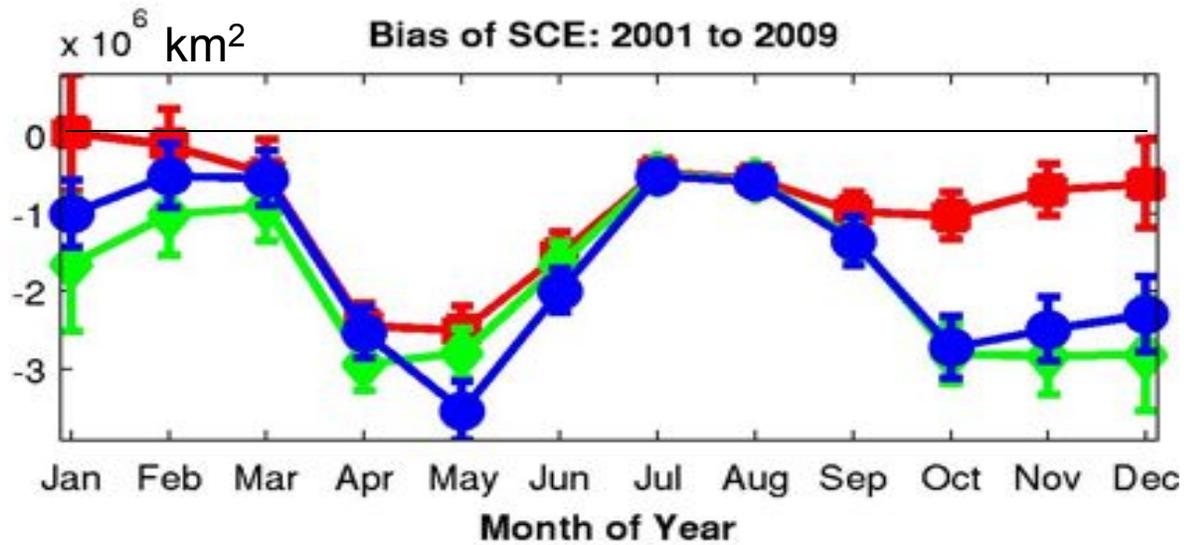

MERRA-Land

Cloud Hit Misses False alarm

## Snow cover extent (SCE) v. MODIS

**Change of WEMIN parameter in “Fortuna” unhelpful for estimation of snow cover fraction.**

[Not sensitive to GPCP precipitation corrections.]

See **poster** by *Toure and Reichle* for details.

\*RMSE normalization vs. max annual SCE.

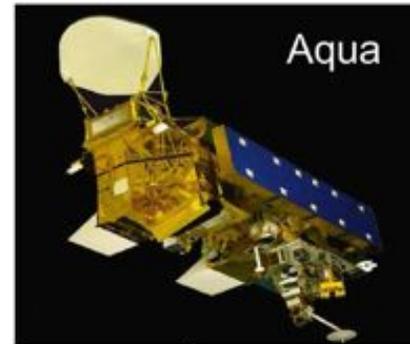

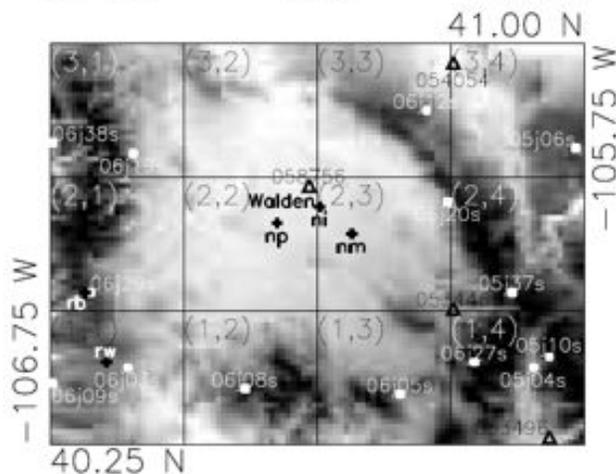

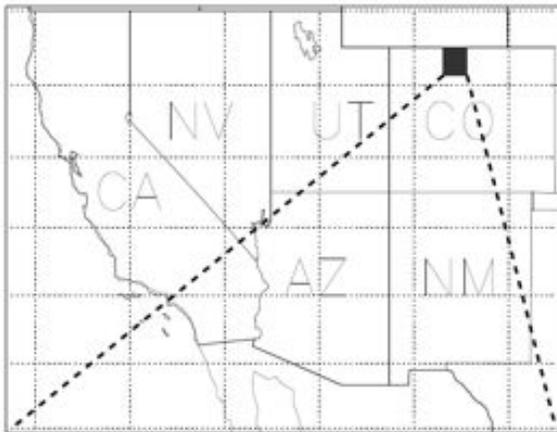

## **Outline**

- 1. Evaluation of GEOS-5 products vs. MODIS SCF***
- 2. Assimilation of MODIS SCF***
- 3. The SMAP Level 4 Carbon product***

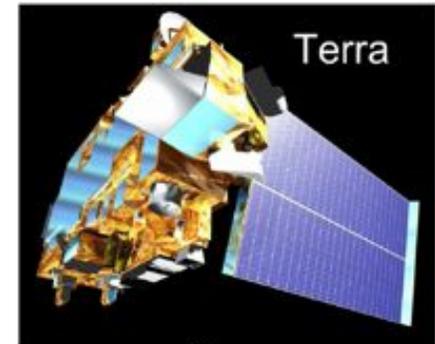

# Assimilation of MODIS snow cover fraction (SCF)

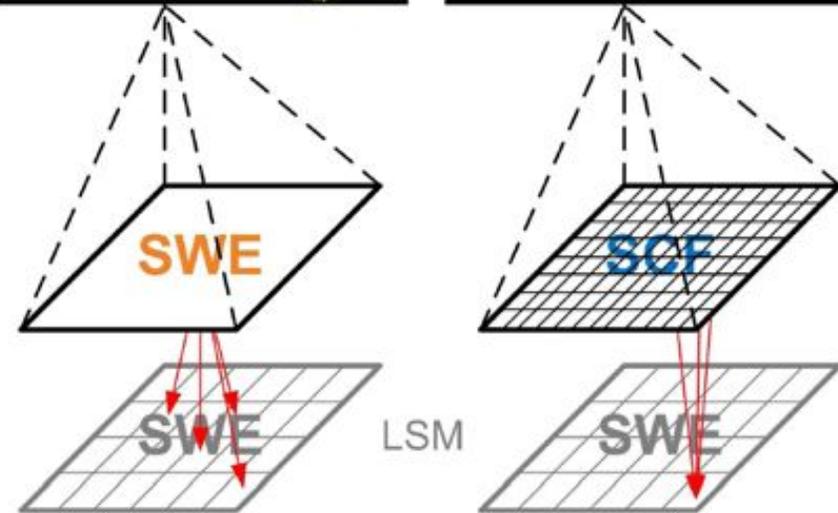

Noah land surface model  
(1 km resolution)  
100 km X 75 km domain  
in northern Colorado

Aqua

Terra

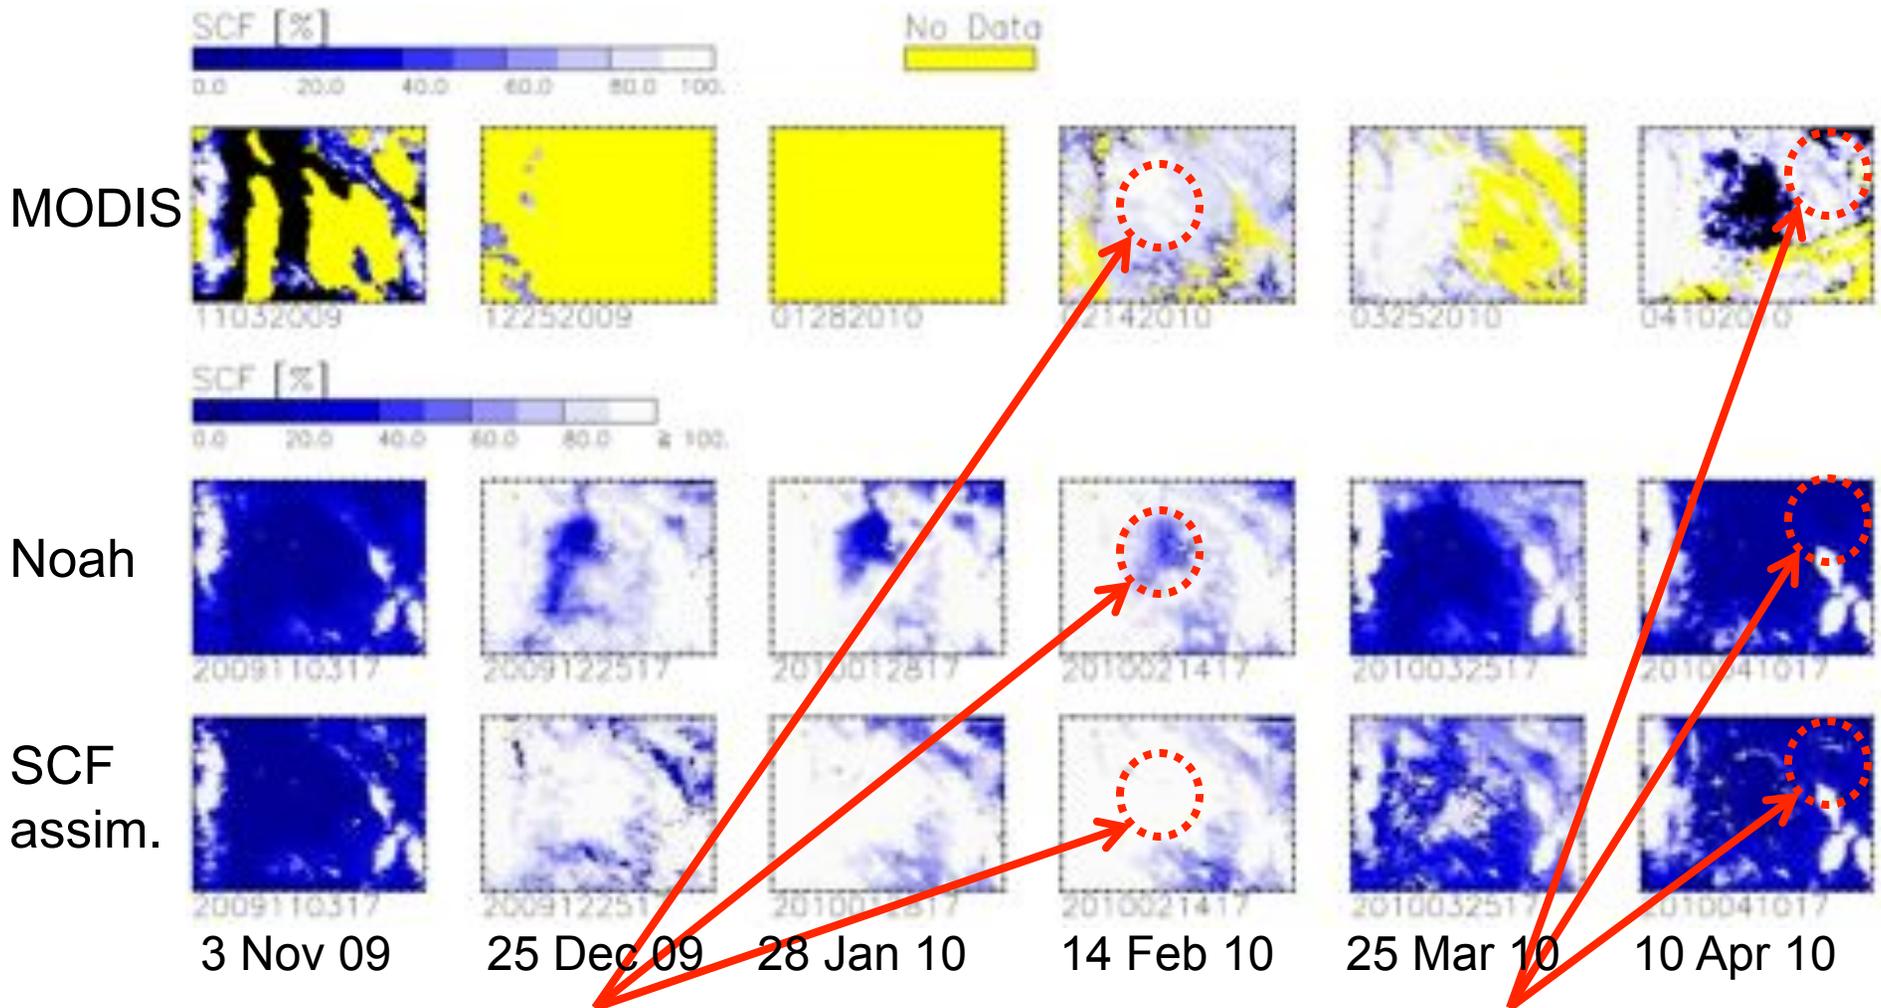

Multi-scale assimilation of MODIS SCF and AMSR-E SWE observations.

Validation against in situ obs from COOP ( $\Delta$ ) and Snotel ( $\blacksquare$ ) sites for 2002-2010.

## Assimilation of MODIS snow cover fraction (SCF)

MODIS SCF successfully adds missing snow, ... except during melt season.

MODIS SCF also improves timing of onset of snow season (not shown).  
See **poster** by *De Lannoy et al.* for more information.

## Outline

1. *Evaluation of GEOS-5 products vs. MODIS SCF*
2. *Assimilation of MODIS SCF*
3. ***The SMAP Level 4 Carbon product***

# SMAP Level 4 soil moisture and carbon products

## L4\_SM Product:

*Lead:* Rolf Reichle, NASA/GMAO

Assimilating SMAP data into a land model driven with observation-based forcings yields:

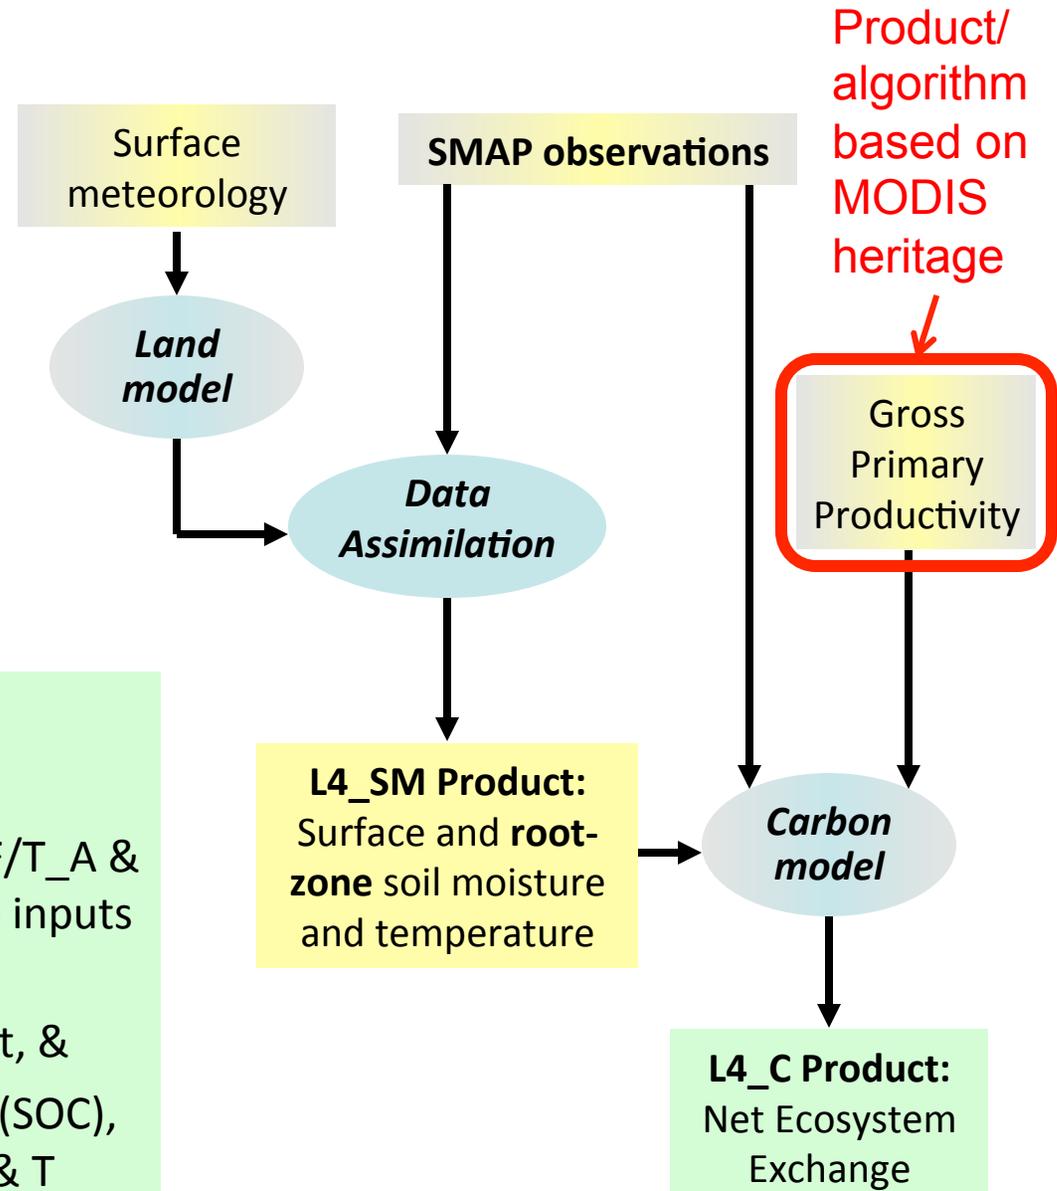

- a root zone moisture product (reflecting SMAP data), and
- a complete and consistent estimate of soil moisture & related fields.

## L4\_C Product:

*Lead:* John Kimball, U Montana

Combining L4\_SM (SM & T), high-res L3\_F/T\_A & ancillary Gross Primary Productivity (GPP) inputs within a C-model framework yields:

- a Net Ecosystem Exchange (NEE) product, &
- estimates of surface soil organic carbon (SOC), component C fluxes (R) & underlying SM & T controls.

## Summary

Used MODIS snow cover fraction (SCF) to assess GEOS-5. SCF estimates from (old) MERRA system agree better with MODIS than those from (new) GEOS-5.7.1 system (but SWE estimates are comparable; not shown).

**MODIS provides helpful information for model development.**

### **MODIS SCF assimilation:**

- can improve model snow estimates, and
- will be included in GEOS-5 land assimilation system.

**MODIS GPP** heritage contributes to SMAP Level 4 Carbon product.

Thanks for listening!

Questions?

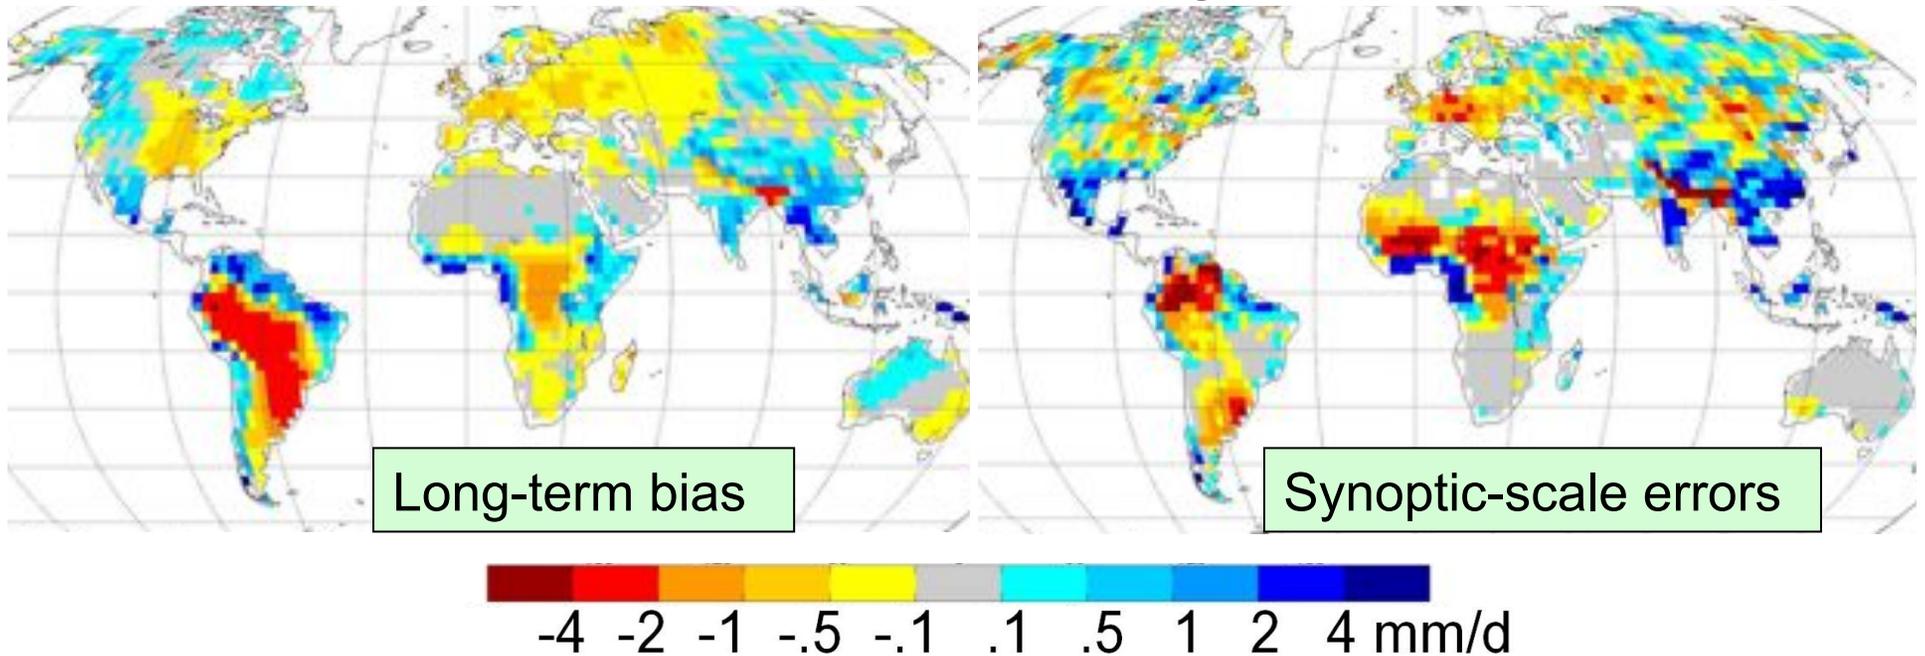

# Precipitation

## MERRA – GPCPv2.1

1981-2008 [mean=-0.03 mm/d]

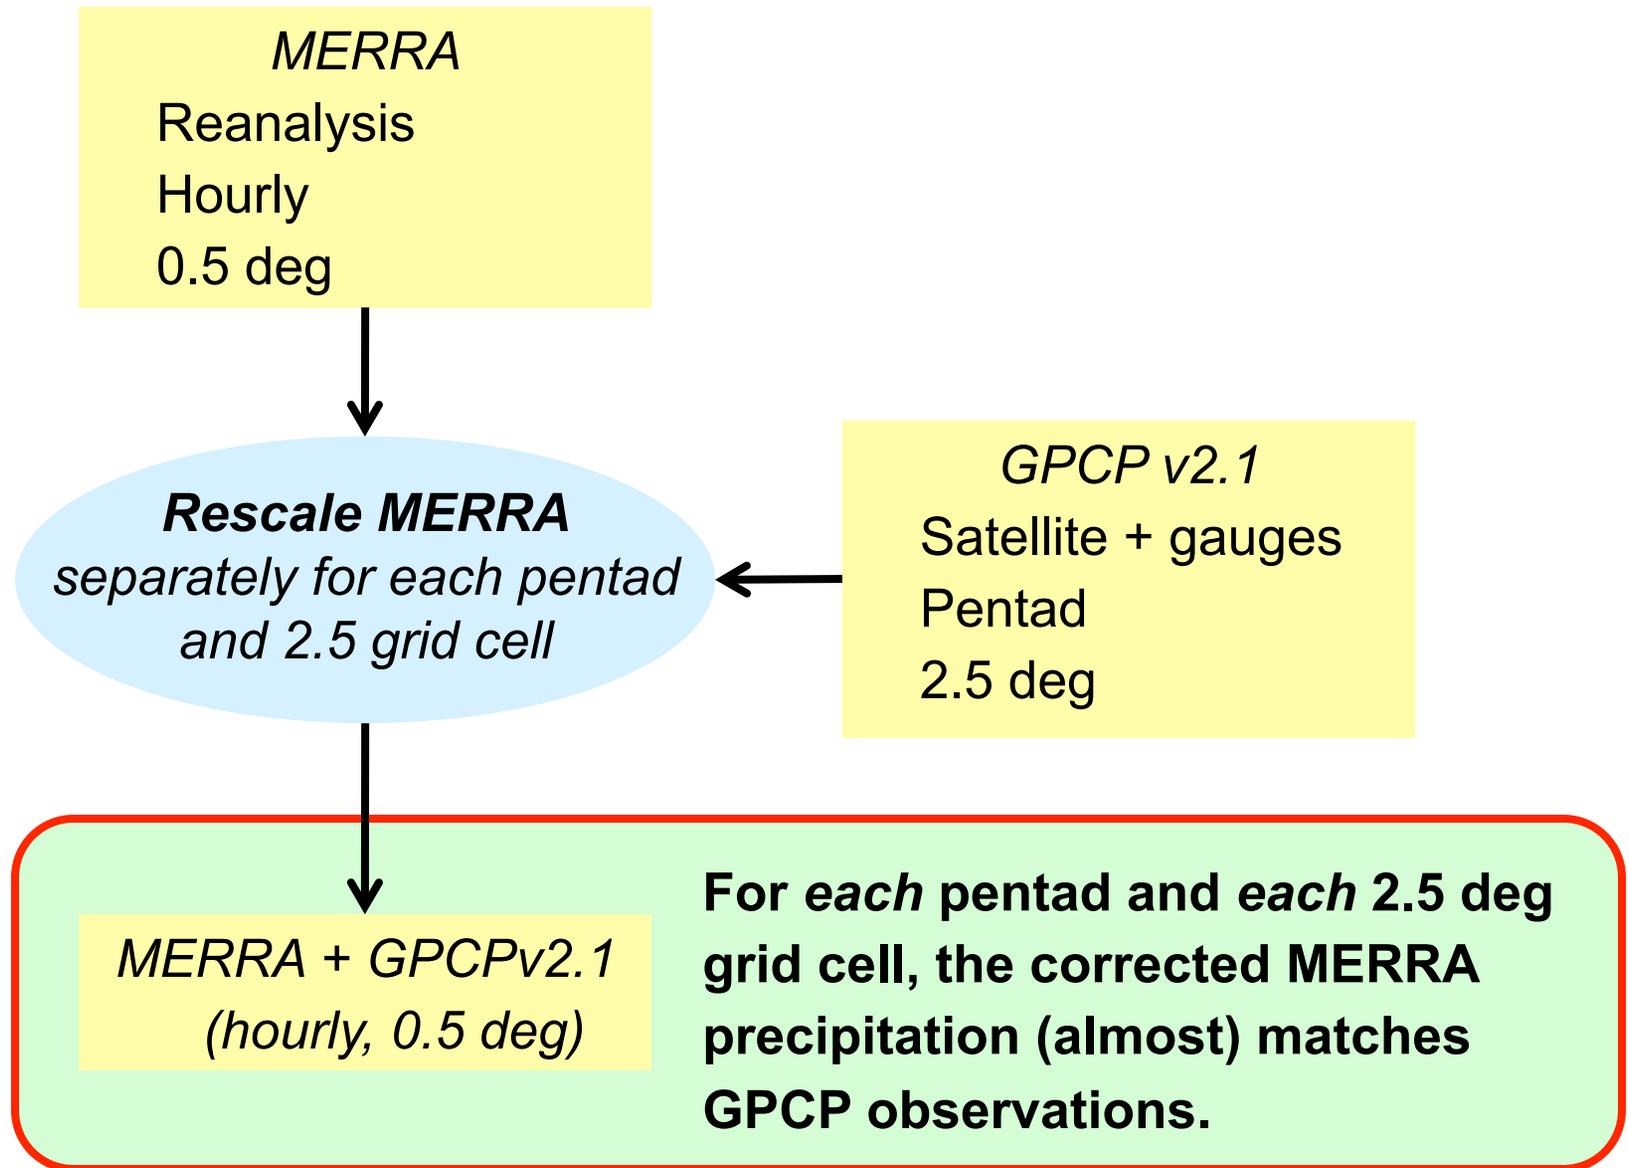

Aug 1994 [mean=-0.04 mm/d]

→ Correct MERRA precipitation with global gauge- and satellite-based precipitation observations to the extent possible.

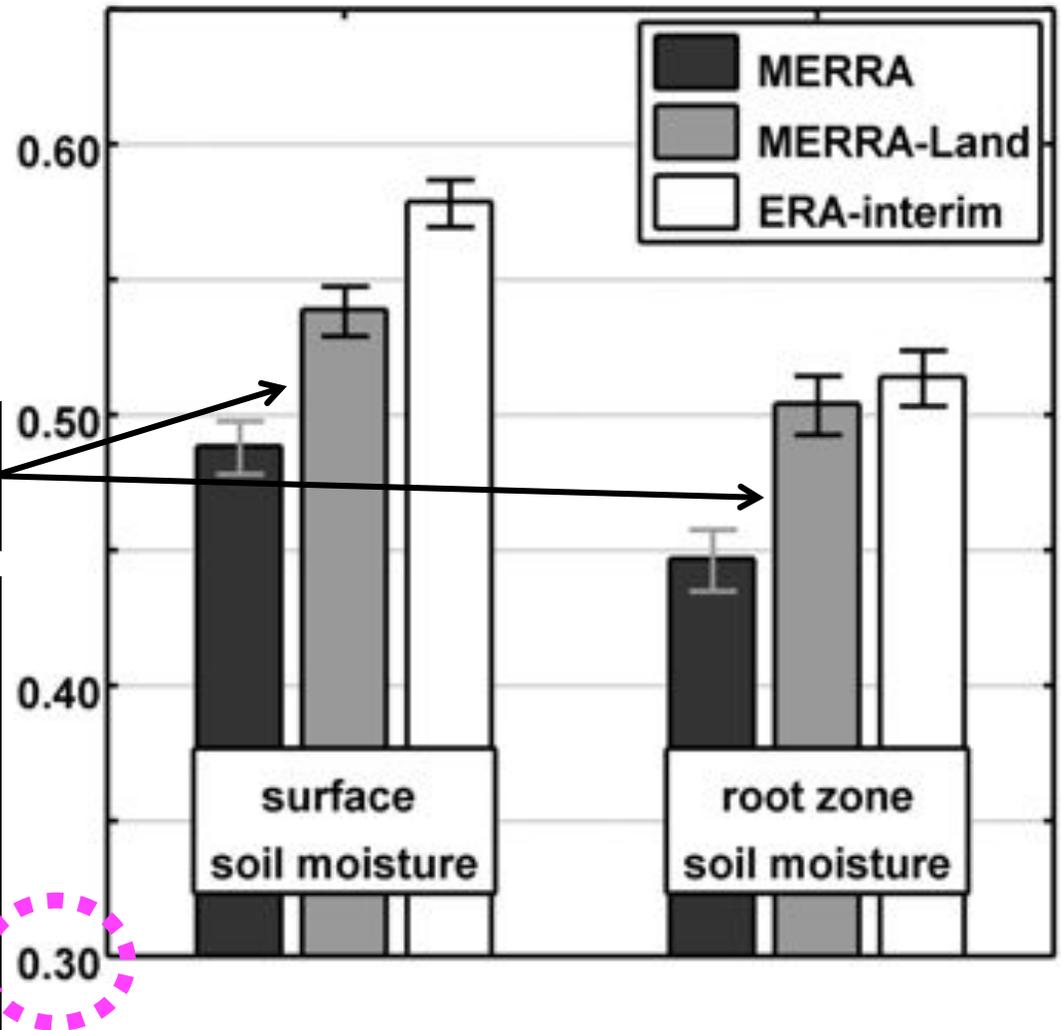

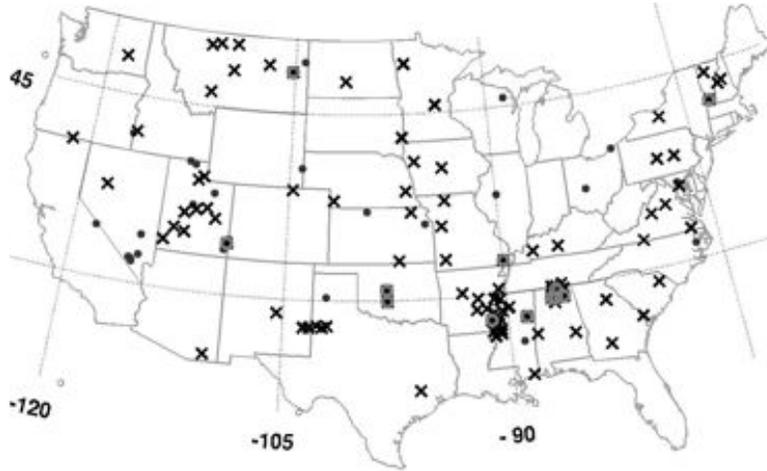

## Precipitation corrections

## Soil moisture validation (2002-2009)

### Pentad anomaly R v. SCAN in situ observations

Better soil moisture anomalies  
(attributed to GPCP corrections).

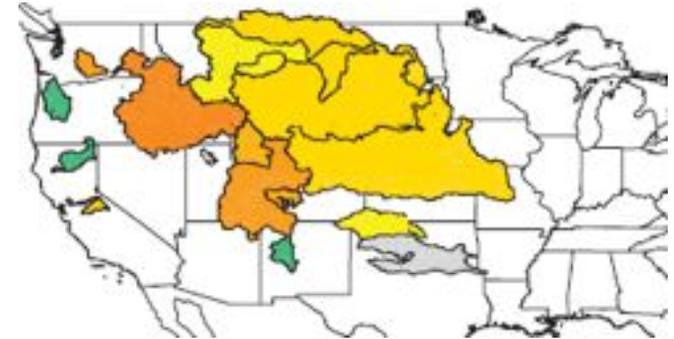

*Additional analysis (not shown):*

- MERRA skill comparable to ERA-Interim (if accounting for layer depth).
- Use of 5 cm surface layer depth in Catchment model is better (currently: 2 cm).

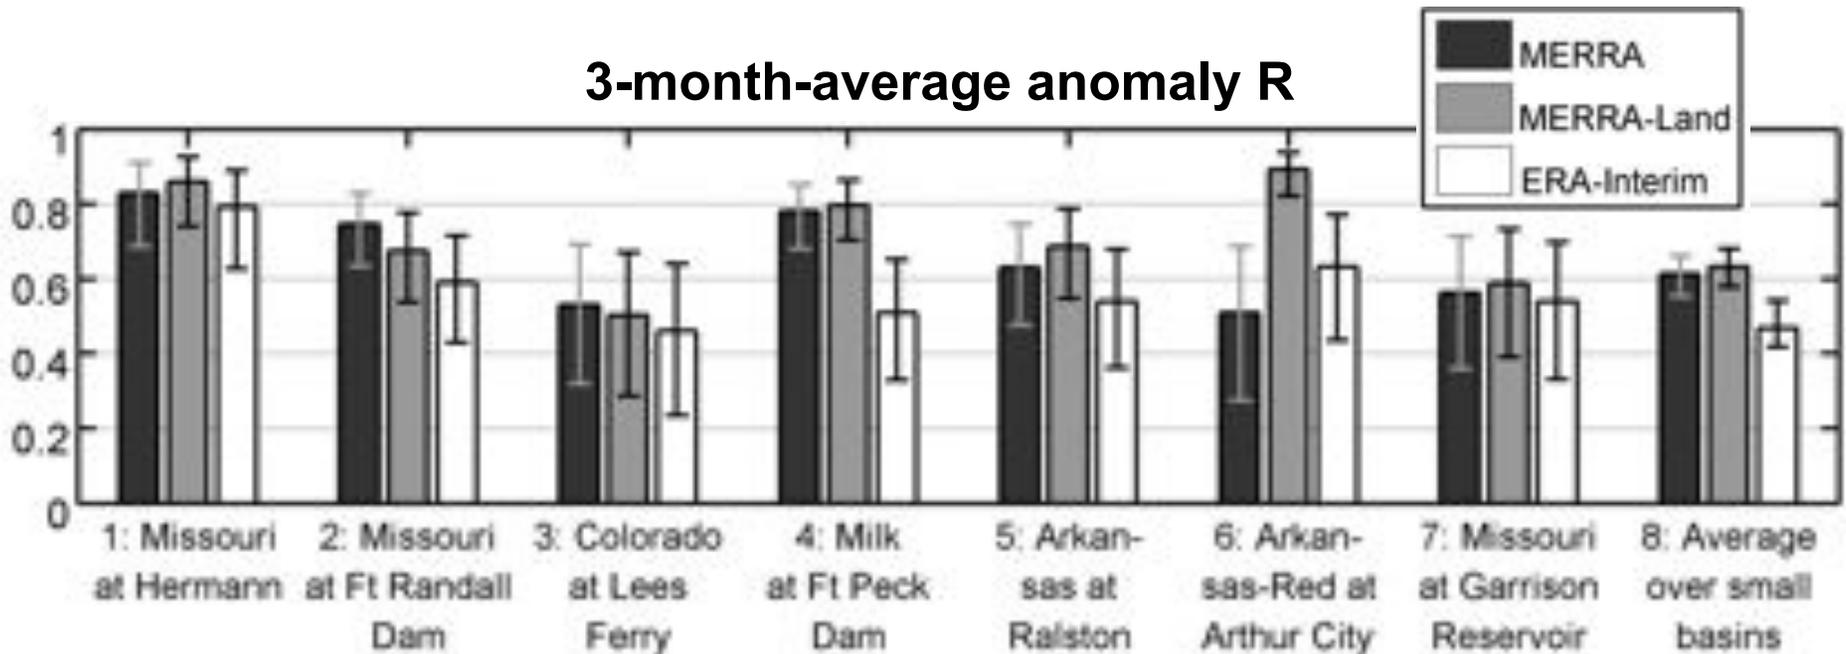

## Runoff

Validation against naturalized streamflow observations from 7 “large” and 8 “small” basins (~1989-2009).

### 3-month-average anomaly R

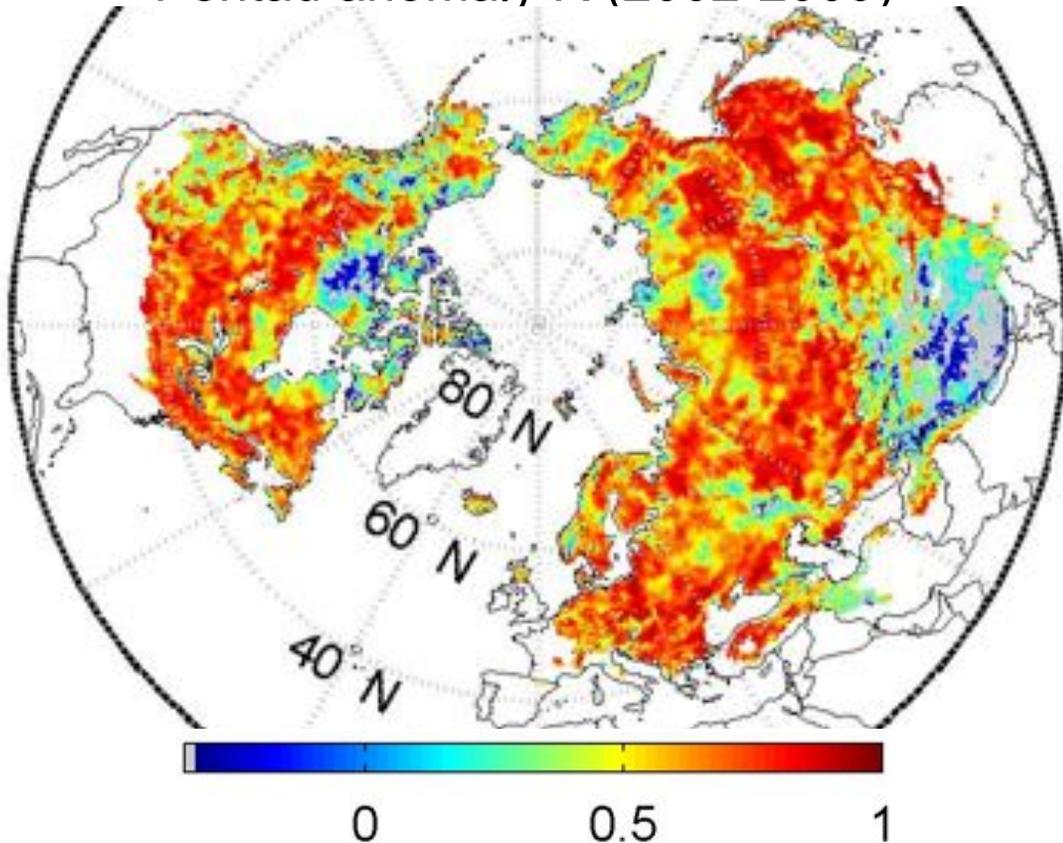

GPCP corrections yield significantly better runoff for Arkansas-Red. MERRA and MERRA-Land (0.5 deg) better than ERA-Interim (1.5 deg).  
*Not shown:* In all cases the revised interception parameters yield improved runoff anomalies (albeit not significant).

## Snow water depth

### MERRA-Land v. CMC snow analysis

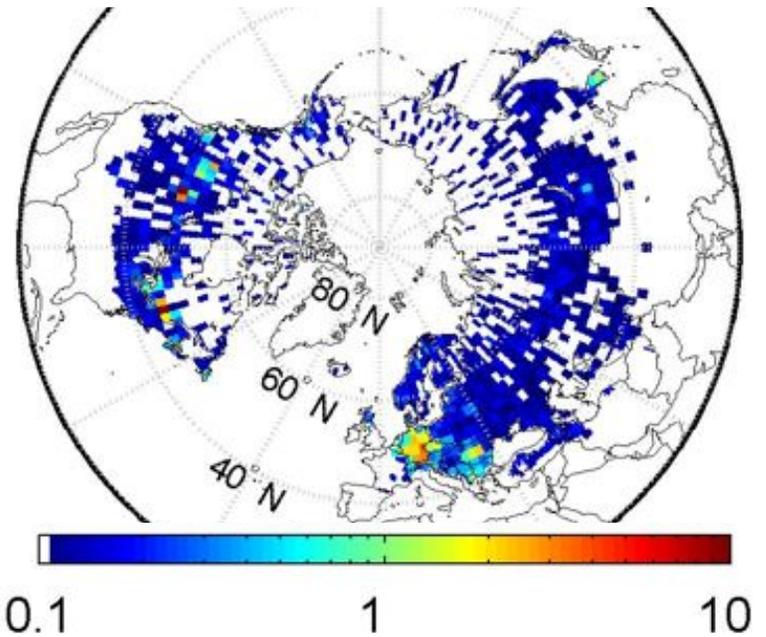

Pentad anomaly R (2002-2009)

Note: No snow analysis in MERRA or MERRA-Land.

### CMC snow analysis

Density [stations/10,000 km<sup>2</sup>]

MERRA and MERRA-Land have similar skill.

Low R values in areas without in situ observations.

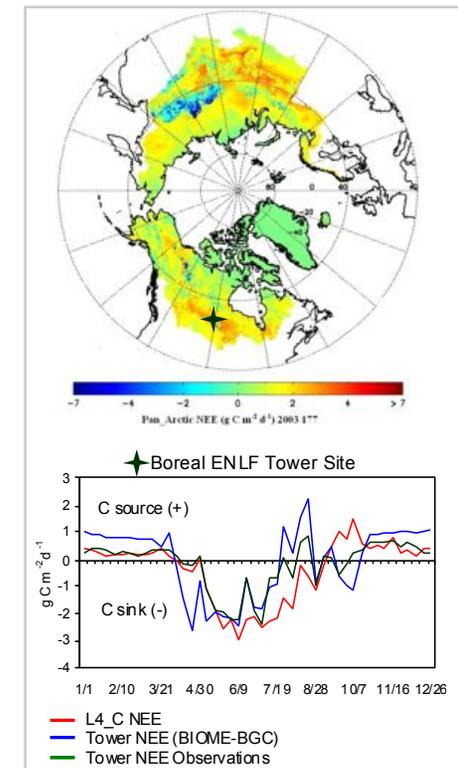

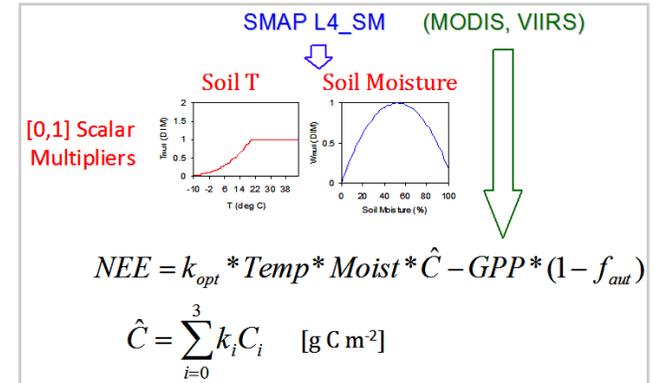

*Not shown:* Similar result for comparison against in situ data (583 stations) and for snow water equivalent (SWE).

# L4\_C baseline algorithm

**Product:** Net Ecosystem CO<sub>2</sub> exchange ( $NEE = GPP - R_{eco}$ )

- **Motivation/Objectives:** Quantify net C flux in boreal landscapes; reduce uncertainty regarding missing C sink on land (NRC Decadal Survey);
- **Approach:** Apply a soil decomposition model driven by SMAP L4\_SM & ancillary (LC, GPP) inputs to compute NEE;
- **Inputs:** Daily surface (<10cm) SM & T (L4\_SM), LC & GPP (MODIS, VIIRS);
- **Outputs:** NEE (primary/validated);  $R_{eco}$  & SOC (research);
- **Domain:** Vegetated areas encompassing boreal/arctic latitudes ( $\geq 45$  N);
- **Resolution:** 9x9 km;
- **Temporal fidelity:** Daily ( $\text{g C m}^{-2} \text{d}^{-1}$ );
- **Latency:** 14-day;
- **Accuracy:** Commensurate with tower based CO<sub>2</sub> Obs. ( $\text{RMSE} \leq 30 \text{ g C m}^{-2} \text{yr}^{-1}$  and  $1.6 \text{ g C m}^{-2} \text{d}^{-1}$ ).

# L4\_C algorithm options

Several L4\_C options are being evaluated based on recommendations from an earlier ATBD peer-review; options designed to enhance product accuracy & utility include:

- Global domain encompassing all vegetated land areas;
- Internal GPP calculations using SMAP L4\_SM, L3\_FT & ancillary land cover (LC) & VI (e.g. NDVI from MODIS, VIIRS) inputs;
- Represent finer scale (<9km) spatial heterogeneity consistent with available LC inputs;
- Explicit representation of LC disturbance (fire) and recovery impacts;
- Algorithm calibration using available observation data (FLUXNET, soil inventories).
