

Rowan Galina Wind was born Monday at 5:29AM

7 lbs, 4 oz

20 inches

Mother and daughter are doing well!

MOD06 Optical/Microphysical Product – C6 Plans and schedule (Platnick, King, Wind, et al.)

- **MOD06_OD**

- Thermodynamic phase, τ , r_e , WP
- 1 km retrievals, global (land, ocean, ice), daytime

- **C5 highlights**

- Primary r_e from band combinations w/2.1 μm , but L2 also includes 1.6 and 3.7 μm retrievals (given as differences w/2.1 μm). L3 aggregations for 2.1 μm retrieval only.
- Ice cloud radiative models from Baum, Yang, et al. (2005)
- Various QA including:
 - “Clear Sky Restoral” (CSR): spatial (edge removal, 250m cloud mask over water surfaces) and spectral tests, used to help eliminate cloudy pixels not suitable for retrievals or incorrectly identified cloudy pixels. MOD35 pixels eliminated via CSR are not processed.
 - multilayer/phase cloud detection (separate aggregation in L3)
- Land and snow/ice spectral surface albedo: gap-filled BU C4 product, Moody et al. (2005)
- Pixel-level baseline uncertainties

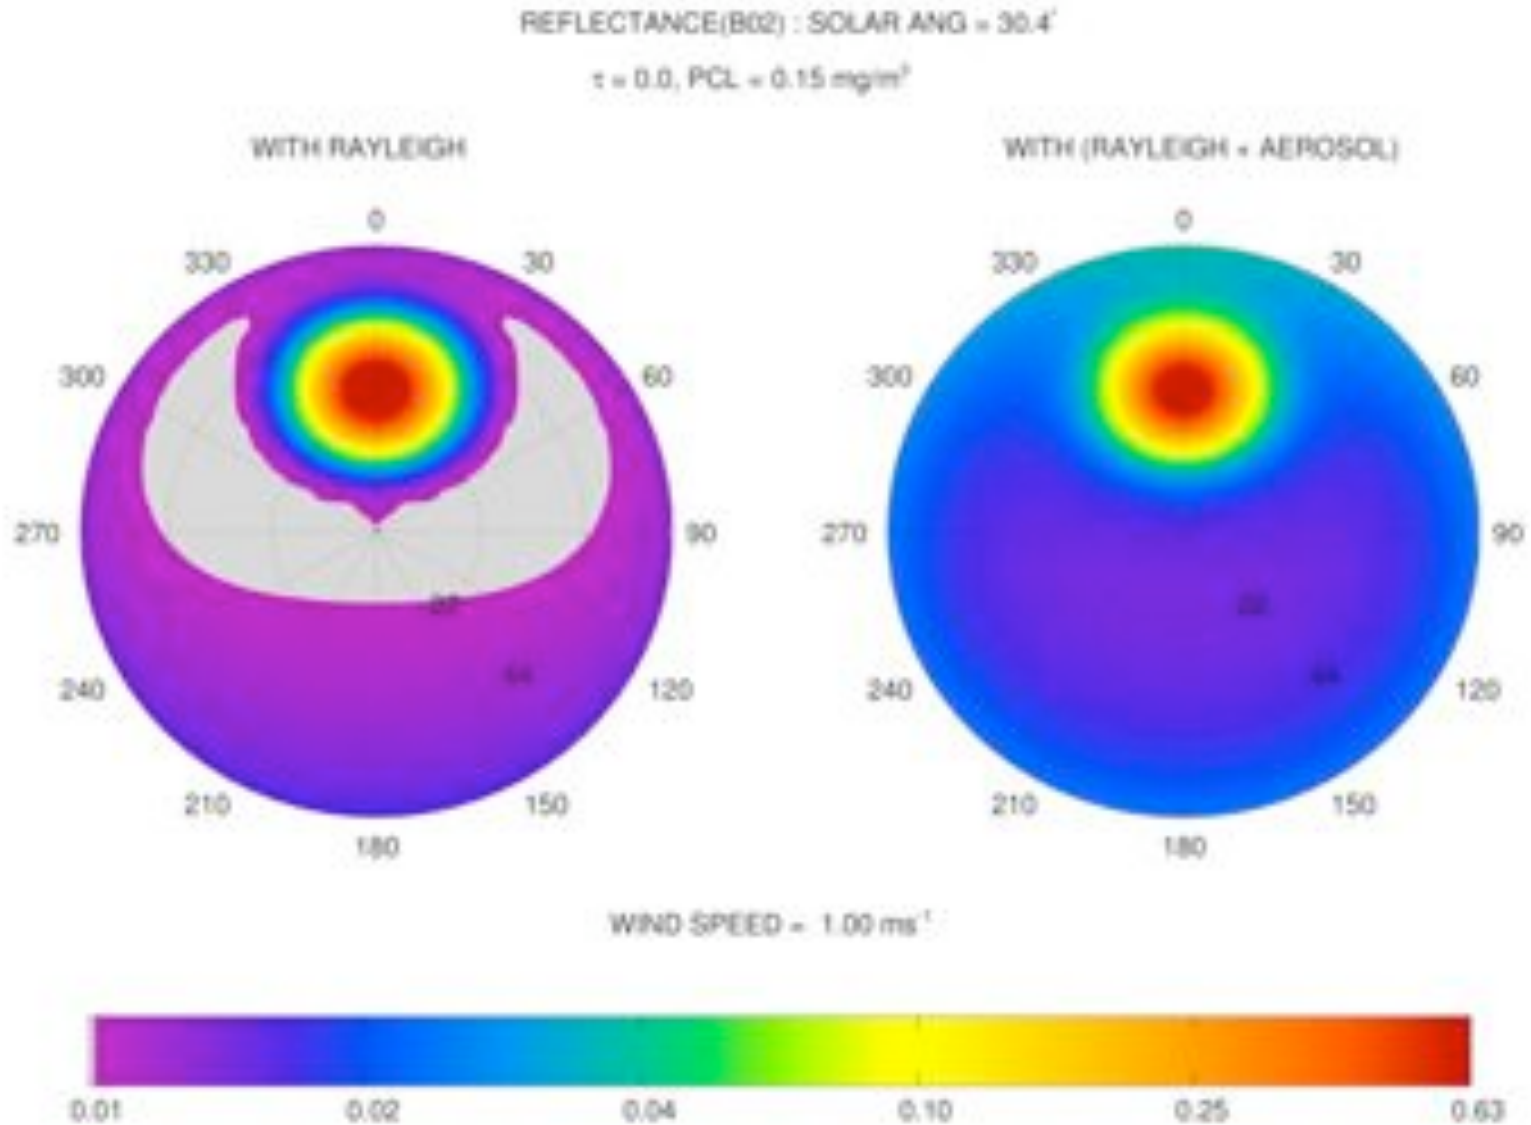

MOD06 Optical/Microphysical Product – C6 Plans and schedule

- **C6 Plan Highlights**

- Includes 1.6 and 3.7 μm retrievals as absolutes, allowing for L3 aggregations.
- Ice cloud radiative models: TBD, but understood to be an important issue. Have included arrays of g_λ and $\varpi_{0,\lambda}$ so users can compare/scale retrievals to their own radiative models.
- Thermodynamic Phase: replace swir to vis/nir ratio tests with separate ice and liquid water retrievals; continue validation vs. CALIOP. (Benjamin Marchant)
- Various QA including:
 - “Clear Sky Restoral” (CSR): Considering processing pixels identified by CSR; add appropriate flag to allow for separate L3 aggregation (which L3 statistics are TBD).
 - multilayer/phase detection: included Pavolonis & Heidinger algorithm.
- Land spectral surface albedo: gap-filled C5 product from BU team.
- Pixel-level baseline uncertainties: link to retrieval QA assignments.
- New LUTs: DISORT w/wind-speed interpolated Cox-Munk BRDF. (Nandana Armarasinghe)

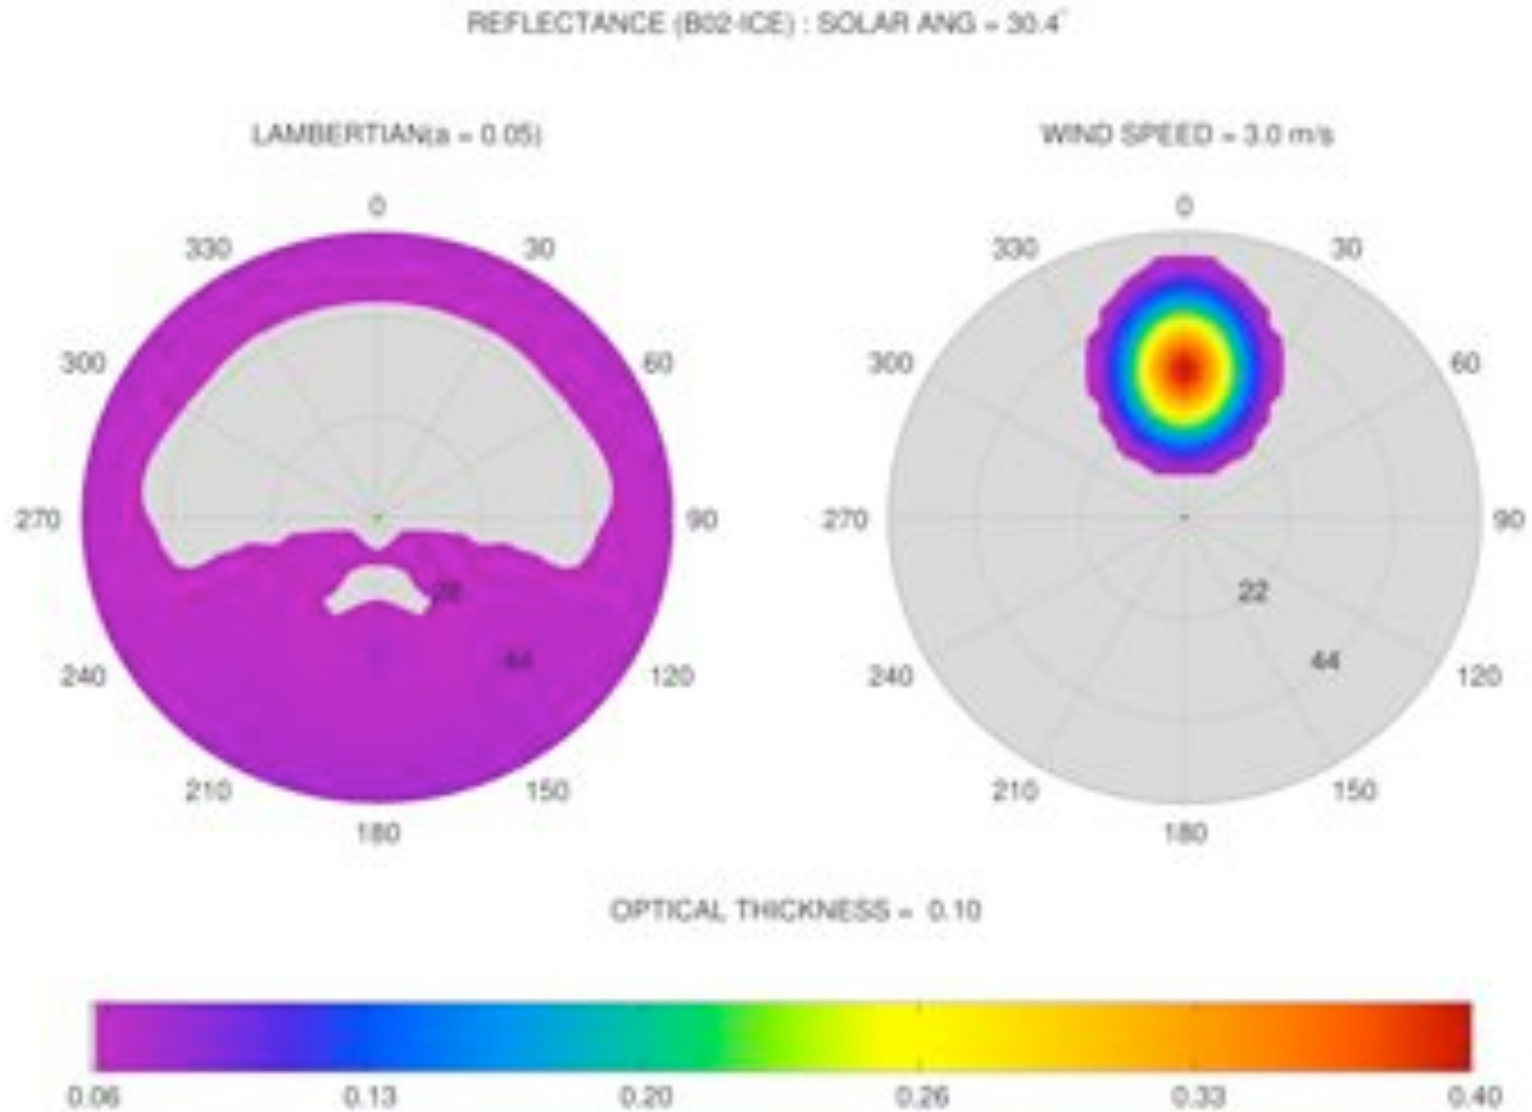

Cox-Munk LUT: Band 2 BRDF vs. Wind Speed Animation

(see Nandana's poster for further details)

Cox-Munk LUT: Band 2 BRDF vs. Wind Speed Animation

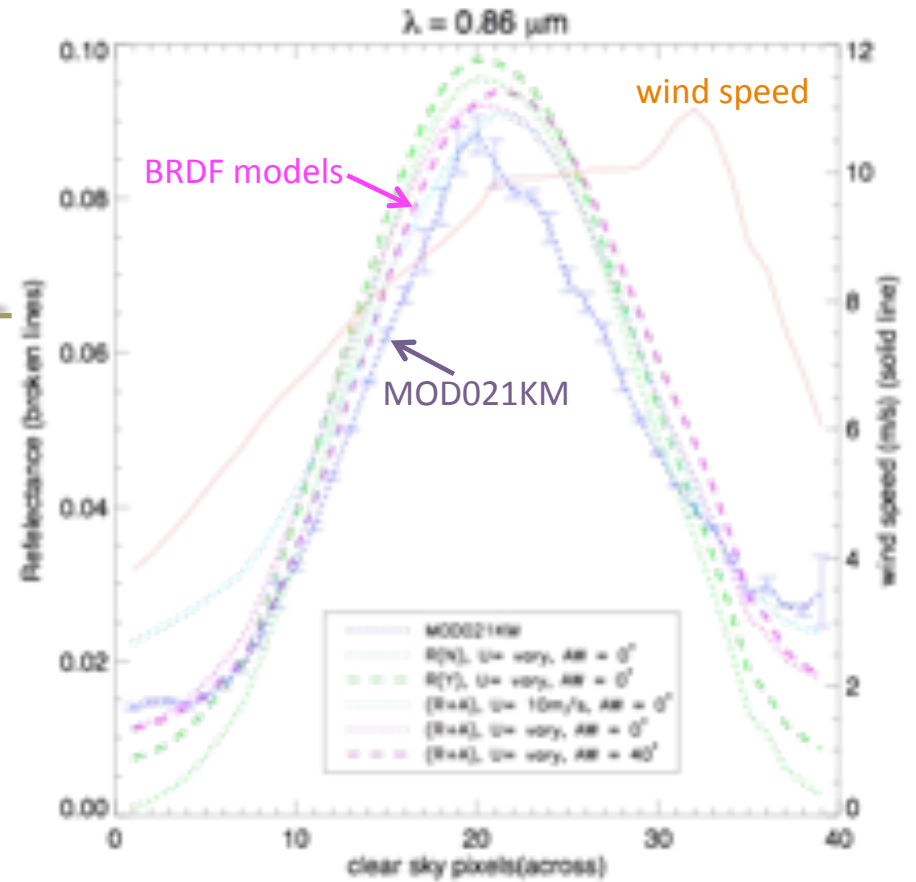

(see Nandana's poster for further details)

Cox-Munk LUT: Band 2 Comparison with MODIS swath data (see Nandana's poster for further details)

MOD06 Optical/Microphysical Product – C6 Plans and schedule

- **C6 Plan Highlights (cont.)**

- Use new C6 1km cloud-top properties. Integrate low-cloud temperature retrievals into the MOD06OD algorithm to include non-unity emissivity (from optical thickness, effective radius retrieval). Iterative approach requiring independent 11 μm cloud-top properties code (retrieval logic and 11 μm radiative transfer code). Consequences for 3.7 μm r_e retrieval.
- Ancillary files.
 - GDAS: use temporally/spatially interpolated surface temperature from Wisconsin 1km cloud-top properties product in 3.7 μm retrieval. Read in the entire profile instead of roughly half of it, as is done currently.
 - NISE: examine possibility/effects of using next day's NISE in order to better capture freshly fallen snow.

- **Schedule**

- Have scoped 12 primary tests, 3 have been completed.
- With assumptions on testing through-put, nominal analysis time, and 50% contingency, don't believe testing will be done until Oct/Nov 2010 ... so inclined to say end of calendar year.

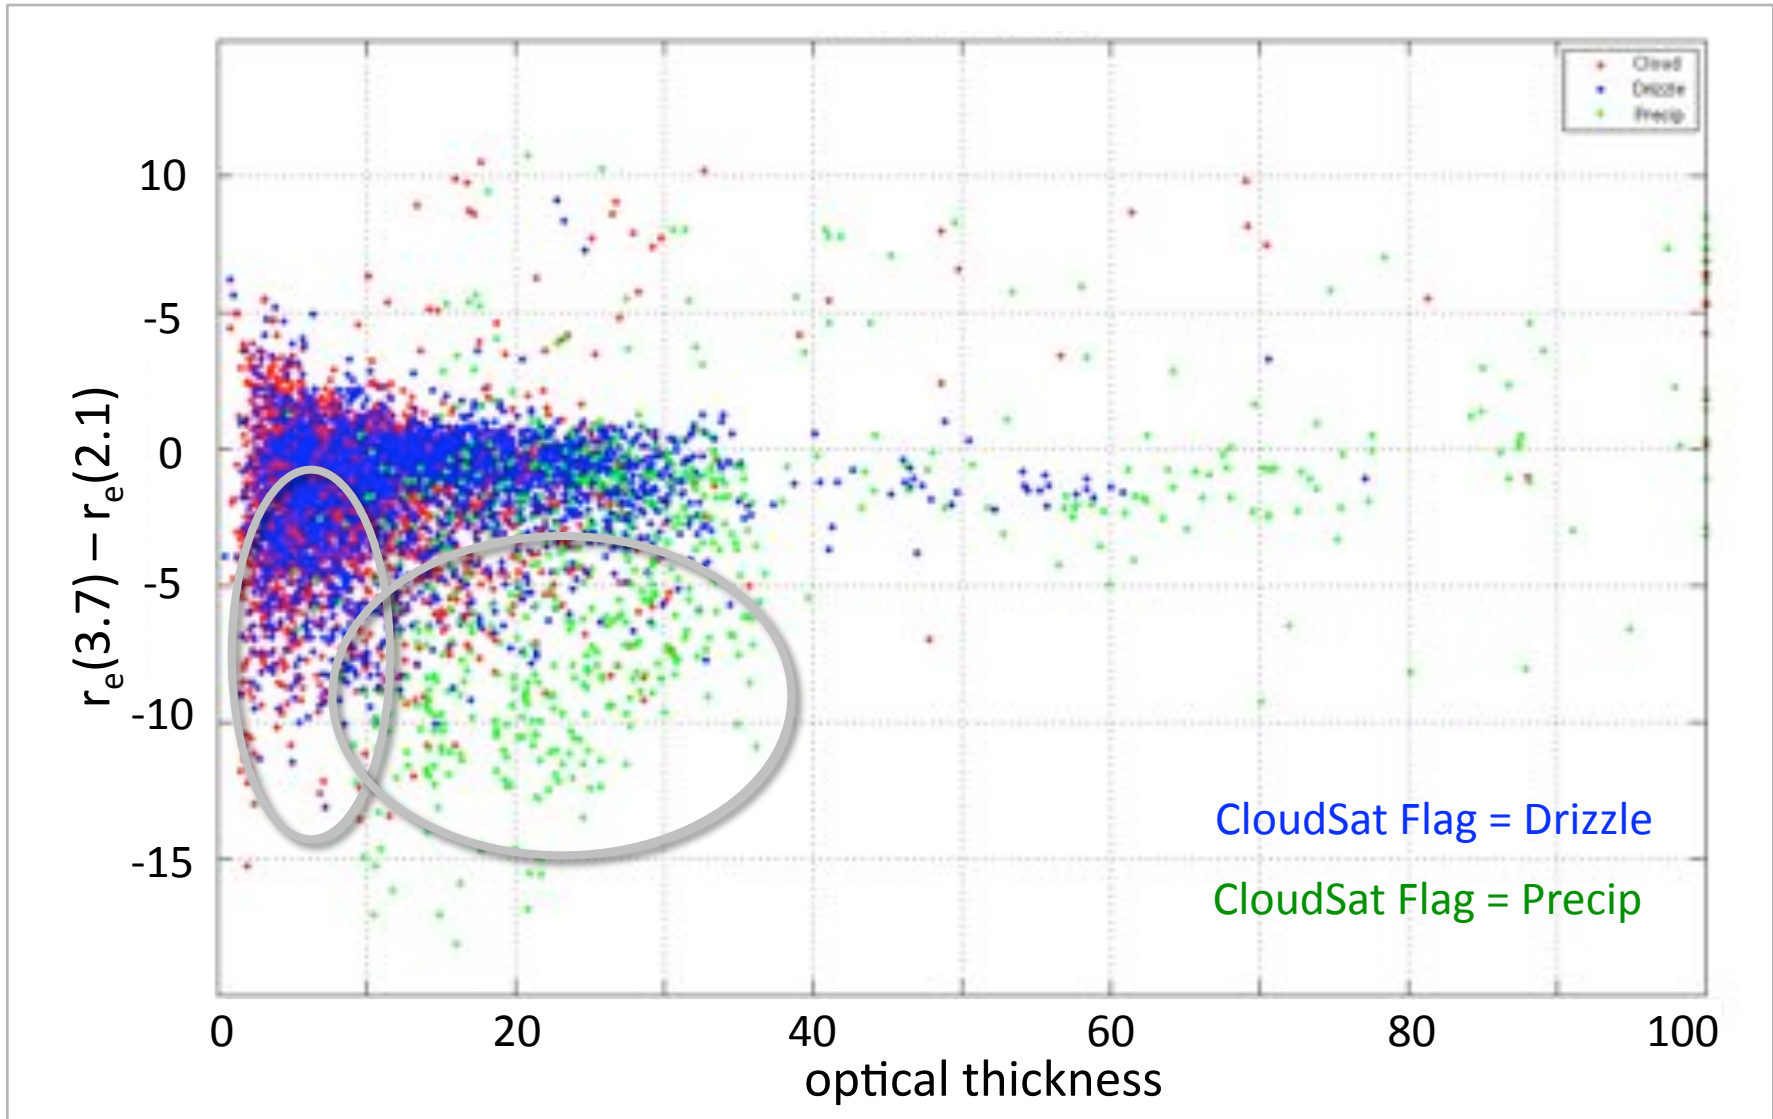

Monthly Mean Cloud Effective Radius: 2.1 vs. 3.7 μm
Terra MODIS June 2005 (Brent Maddux et al.)

Monthly Mean Cloud Effective Radius: 2.1 vs. 3.7 μm
Terra MODIS June 2005 (Brent Maddux et al.)

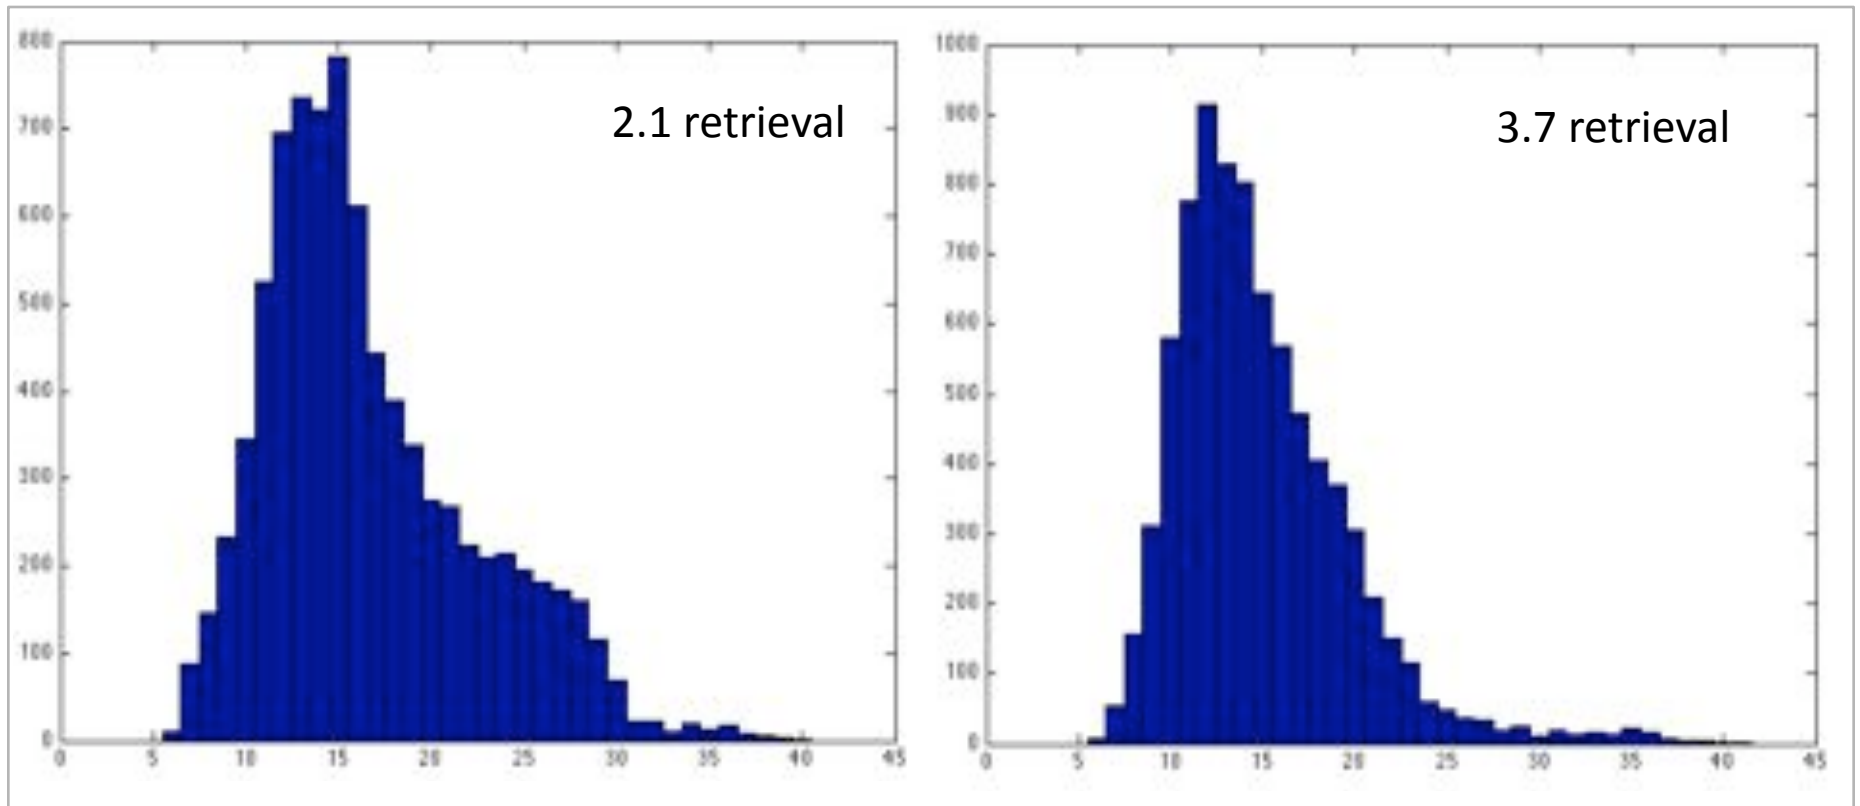

Cloud Effective Radius Regional Differences: 2.1 vs. 3.7 μm
Region off the coast of Peru/Chile, Multiday MODIS Aqua + CloudSat
(Brent Maddux, Ralf Bennartz, et al.)

Cloud Effective Radius Differences: 2.1 vs. 3.7 μm

Region off the coast of Peru/Chile, Multiday MODIS Aqua + CloudSat
(Brent Maddux, Ralf Bennartz, et al.)

MODIS retrieval histograms w/no CloudSat drizzle or precip detection

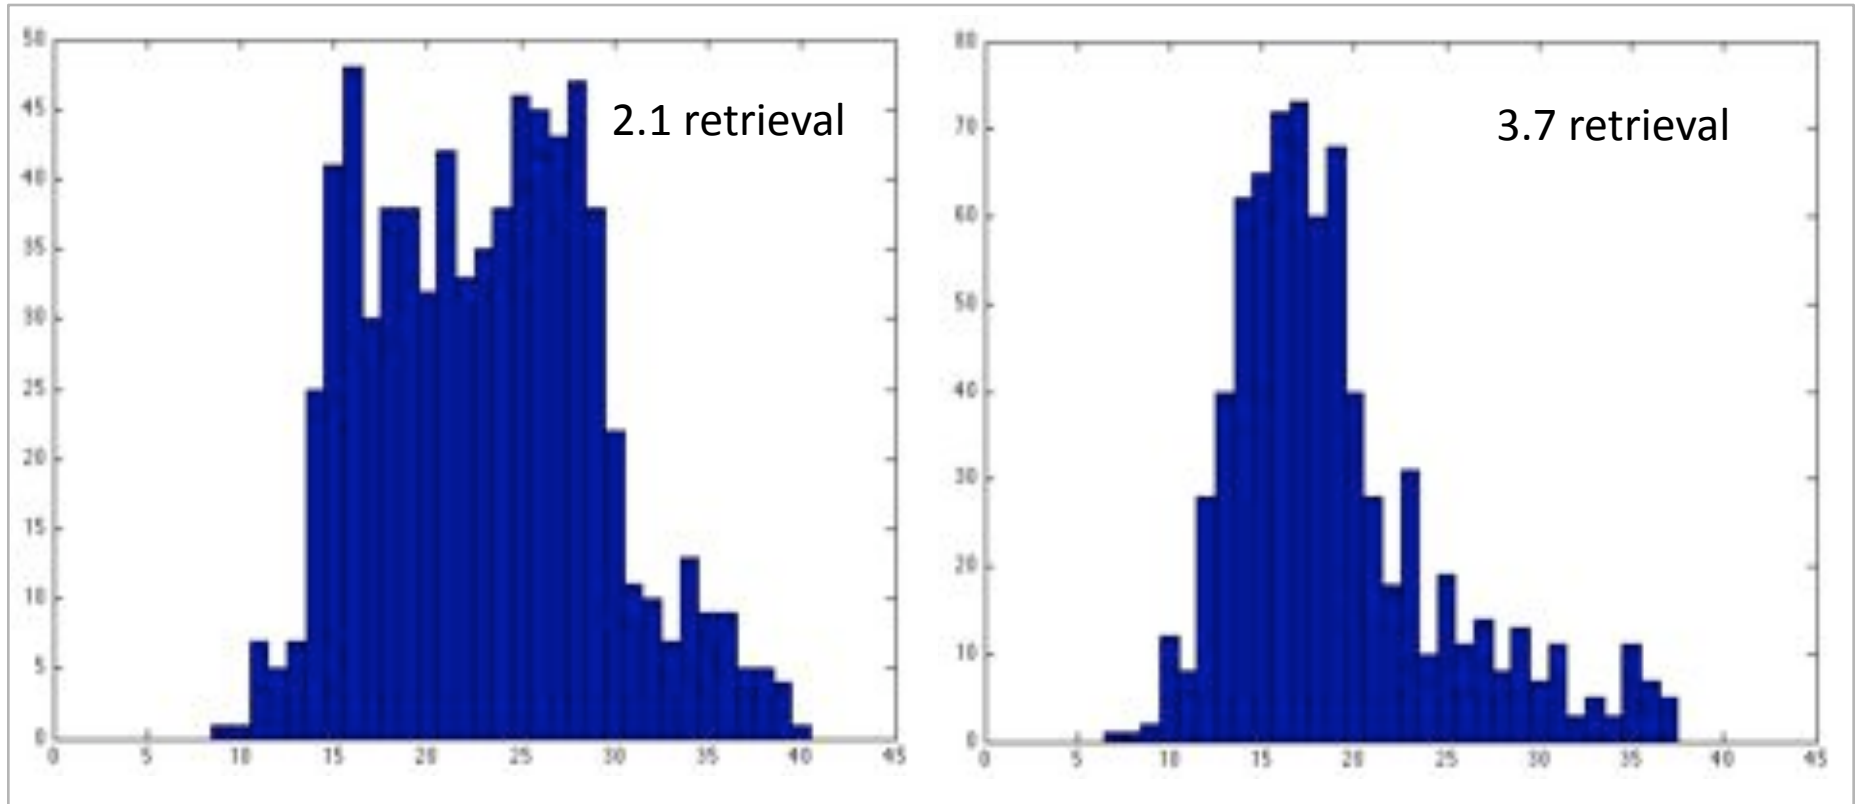

2.1 μm retrieval histogram broader than 3.7 μm

Cloud Effective Radius Differences: 2.1 vs. 3.7 μm

Region off the coast of Peru/Chile, Multiday MODIS Aqua + CloudSat
(Brent Maddux, Ralf Bennartz, et al.)

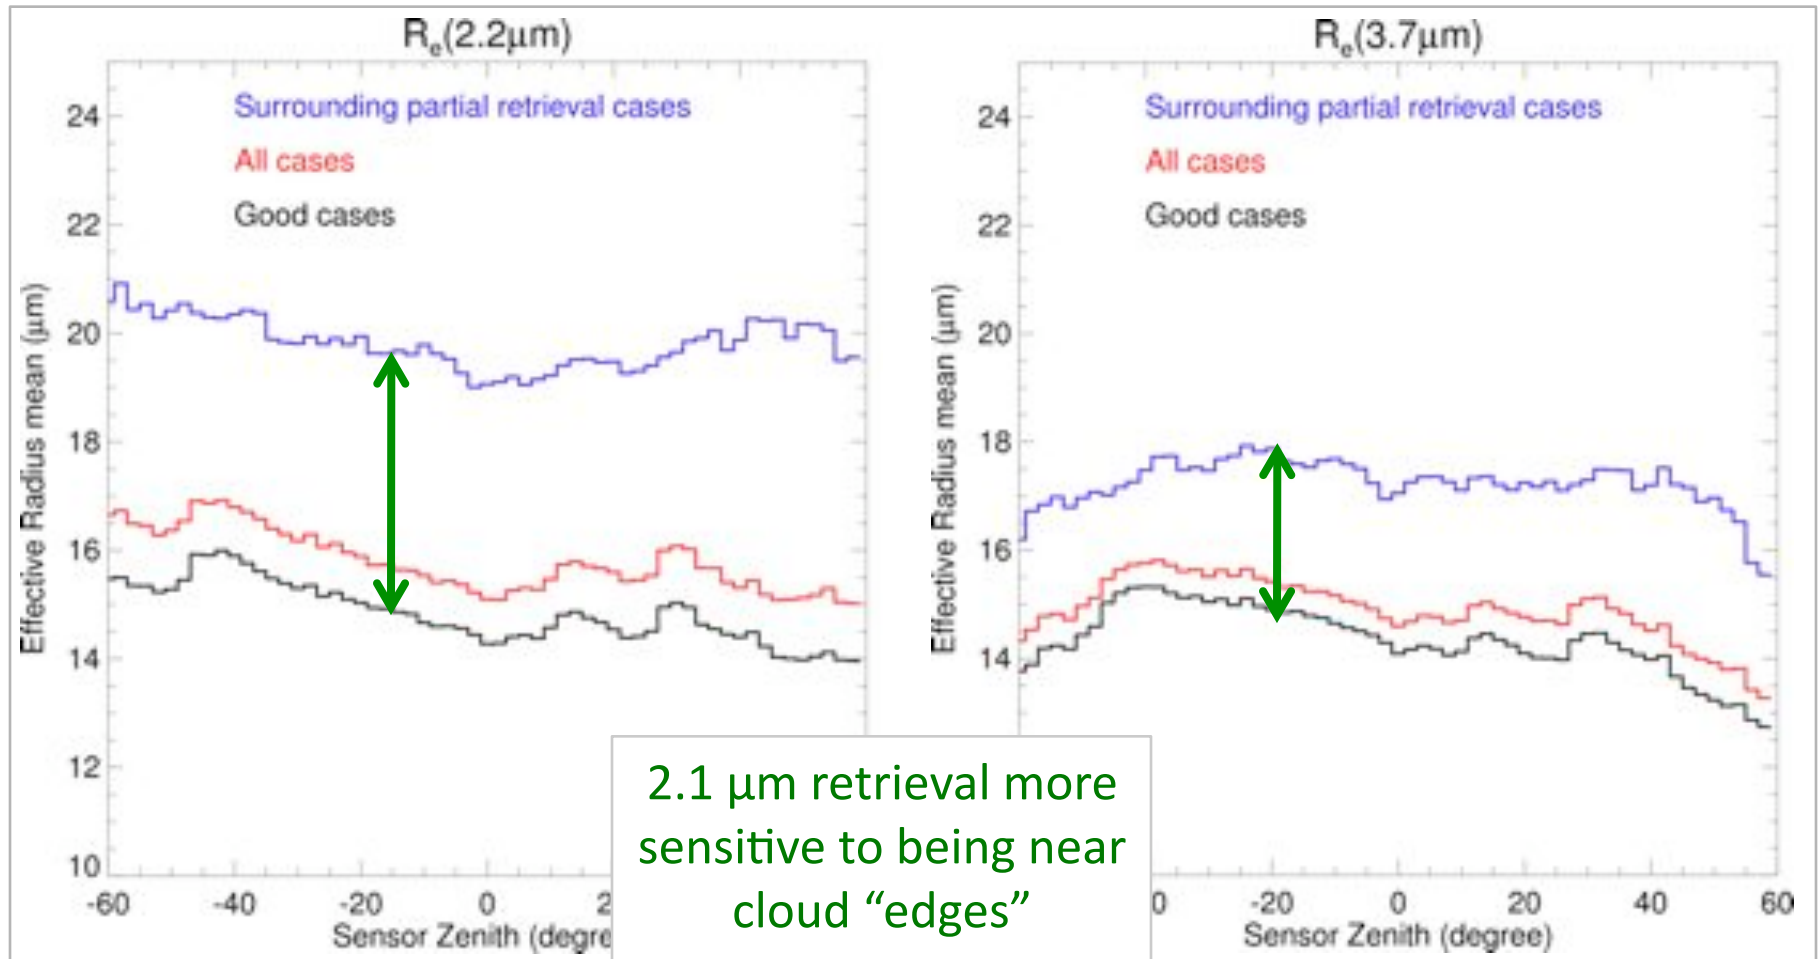

MODIS retrieval histograms w/CloudSat precip. detection

Both retrievals larger in presence of precipitation,
but 2.1 μm retrieval more sensitive
(though few occurrences of precip. flag)

Cloud Effective Radius Differences: 2.1 vs. 3.7 μm

Retrievals vs. VZA, Multiday granules off cost of Peru/Chile (Z. Zhang)

Summary of 2.1 μm vs. 3.7 μm r_e Results

For water clouds, so far ...

- Global r_e statistics between 2.1 and 3.7 μm retrievals are significantly different.
 - Shouldn't directly compare MODIS standard retrieval (2.1 μm) with AVHRR or MODIS/CERES 3.7 μm derived data sets.
 - Differences between these data sets are due to choice of bands used, not algorithmic.
- Adiabatic-like relations between the retrievals can be found, but dramatically different in oceanic broken cloud regions.
 - From prelim. CloudSat study (single region), most dramatic differences appears to be related to drizzle/precip which may be correlated with broken clouds.
 - Some/more significant positive (2.1–3.7) bias with VZA (beyond pixel level uncertainties) in broken oceanic regions.
- Pursuing MOD06 retrievals from marine BL LES runs

CRM Modeling Study: 1.6 and 2.1 vs. 3.7 μm r_e Retrievals

- Zinner et al., *ACPD*

LES fields (A. Ackerman)

- 12 km square fields, 50m horizontal, ~20m vertical
- RICO and FIRE-I simulations
- Cloud microphysics are reported in 25 droplet size bins, ranging from 1 to 280 μm radius

Monte Carlo simulations (T. Zinner)

- MYSTIC + libRadtran (Mayer, 2000)
- bi-modal Gamma function distributions (droplet and drizzle modes, separately)
- no atmosphere (apart from $T(z)$ in cloud), black surface
- SZA = 10° and 45°, nadir view

MOD06 retrievals

Results: 3D effects minimally affect mean values, though increase the range of scatter for the LES cases analyzed.

CRM Modeling Study: 1.6 and 2.1 vs. 3.7 μm r_e Retrievals

- Zhibo Zhang et al.
 - LES fields (B. Stephens – finished several runs; G. Feingold – starting runs)
 - Monte Carlo simulations
 - I3RC code (Pincus et al.)
 - no atmosphere (apart from $T(z)$ in cloud), black surface
 - MOD06 retrievals
- Results: 3D effects minimally affect mean values, though increase the range of scatter for the LES cases analyzed.
