BELMANIP2 sites

AVHRR

MODIS Aqua/Terra

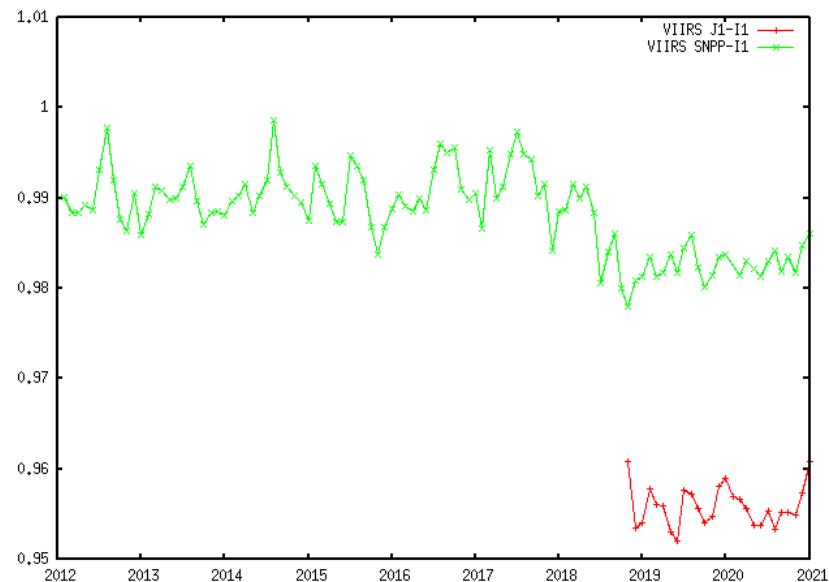

VIIRS / Aqua MODIS

Automated monthly VIIRS cross comparison (over BELMANIP sites) with MODIS Aqua from 2012. the stability of both VIIRS and MODIS Aqua is excellent in both red and NIR as shown (+/- 0.5%).

BELMANIP CROSS-CALIBRATION VIIRS SNPP, NOAA20 / MODIS Aqua

SPECTRAL INTERCALIBRATION OVER DCC FOR VIIRS SNPP, NOAA20 / MODIS /Terra,Aqua

- SNPP and Aqua match pretty well in Red/Green ratio. So Red difference between SNPP and Aqua over BELMANIP is probably due to spectral differences (TBC) and/or is probably small. The Green difference between SNPP and Aqua is also small (~0.5%)
- The NIR difference between SNPP and Aqua is likely real because spectral differences are expected to be small (M7/I2 are really similar over BELMANIP) and is confirmed by Red/NIR DCC ratio ~2%

SUMMARY

- Analysis need to be repeated with MODIS C6.1
- DCC cloud ratio approach needs to be refined (atmospheric correction) and verified
- Some spectral correction needs to be implemented for VIIRS
- Overall, the current results show that SNPP might need some adjustment in some bands (decrease NIR by ~2%) but J1 needs adjustment in all bands (increase Green by 3%, Red and NIR by 2%)
- We should explore extending the approach to more bands.
